## **ABSTRACT**

### **Background and objectives:**

In the recent times, medico-legal cases are on the rise. Pattern of Medico-legal cases is of importance for those, who are related with Law and Order, doctors and who are concerned with their documentation. Hence the present study is undertaken to know the pattern of medico-legal cases.

### **Methods:**

Present cross-sectional study was conducted at KLES'S DR. Prabhakar Kore Hospital and MRC, Belgaum from 01-01-2009 to 31-12-2009. Total of 2120 cases registered at the medico-legal register were studied.

### **Results:**

Out of 2120 cases, RTA constituted the maximum of 68.8%. Maximum number of victims (33.5%) was between 21-30 years and 75.2 % of victims were males. More than 50% of incidents occurred in urban areas and the mortality rate was 9%. Occupants of motor cycle (59.8%) cases were the highest number of victims involved in RTA. Commonest cause of death in RTA's was head injury (59.1%). Majority (26.1%) of the fall cases were from staircase. With regards to poisoning, agriculturists were the highest (43.1%) in number among the victims and agrochemicals (67.0%) were the commonest type of poison. Maximum (69.5%) cases of burns were due to dry heat and the most common cause of burns was flame (45.2%). Majority of assault cases (71.0%) were by hard blunt weapon. Most common animal species involved in bites were snakes (53.3%). Maximum number of mechanical asphyxia cases was due to hanging (52.4%).

## **Conclusion and interpretation:**

Various preventive measures can be employed to minimize the medico-legal cases. The results of the present study could be useful in interpreting the types of medico-legal cases and strategic planning can be made accordingly for the benefit of the community and people at large.

## **Keywords:**

Medico-legal case; Road traffic accident; Burns; Poisoning; Fall from height; Assault; Bites and stings; Mechanical asphyxia.

## **INTRODUCTION**

Medico-legal case is a case of injury or illness where the attending doctor, after eliciting history and examining the patient, thinks that some investigation by law enforcement agencies is essential to establish and fix responsibility for the case in accordance with the law of land. Simply put, it is a medical case with legal implications or a legal case requiring medical expertise.<sup>1</sup>

The cases treated as medico-legal are all cases of road traffic and roadside accidents, accident or unusual occurrences in a factory, all cases of serious injury, suspected homicidal injuries, suspected self-inflicted injuries, suspected attempts at suicide, burn injuries due to any cause, suspected or evident poisoning, any injury where foul play is suspected, and the injured appears to be either a victim or the culprit in a criminal case, suspected or evident sexual offences, suspected or evident criminal abortions, suspected or evident child abuse, suspected or evident intimate partner abuse, unconscious patients where the cause of unconsciousness is not clear, cases brought dead to hospital with improper, inadequate and incomplete history, cases referred by the police or a court of law for some specific legal or medico-legal requirement.<sup>2</sup>

In recent days, medico-legal cases are on the rise.<sup>3</sup> This may be due to increased vehicular traffic density, un-employment, high income disparities, substance abuse, meager infrastructure facilities, insurance/compensations, etc.

Pattern of Medico-legal cases is of importance for those, who are directly or indirectly related with Law and Order, who treat them and also who are concerned with the etiology, manner of causation and their documentation.<sup>3</sup> If pattern of cases that present to an emergency or elective setup is known, one can get better acquainted

with more types of medico-legal cases and have better understanding for them. As a result of which, a medical practitioner shall be more comfortable in dealing with such cases.

Data available in the literature regarding the pattern of medico-legal cases are mostly from the northern parts of India, some in south India and few in Karnataka. But, most of the available studies are based on individual type of medico legal cases. Hence, the results of the present study could be useful in interpreting the types of medico-legal cases and then strategic planning can be made accordingly for the benefit of the community and people at large.

Keeping this in mind, the study was undertaken to know the pattern of medico-legal cases that presented at KLES'S DR.Prabhakar Kore Hospital and MRC, Belgaum. This hospital is a tertiary referral center with sophisticated intervention and diagnostic facilities having expert and skilled specialist doctors. Cases of road traffic accidents, fall from height, accidents in industries and factories, all cases of poisoning, burns, snake bites and all other emergency cases are referred from various parts of the district including the neighboring states of Maharashtra and Goa.

**OBJECTIVES**

The present cross sectional study is undertaken at KLES'S DR.Prabhakar Kore Hospital and MRC, Belgaum, on the medico-legal cases that were registered at casualty register with the following objective:

1. To study the pattern of medico-legal cases.

## **REVIEW OF LITERATURE**

### **Medico-Legal Case:**

Medico-legal case is a case of injury or illness where the attending doctor, after eliciting history and examining the patient, thinks that some investigation by law enforcement agencies is essential to establish and fix responsibility for the case in accordance with the law of the land. In other words, 'it is a medical case with legal implication' or 'a legal case requiring medical expertise'.<sup>1</sup>

The decision to register any case as a medico-legal case rests solely with the doctor who attends to the case. A doctor must always exercise his Judgment independently and with complete objectivity. In referred cases, where a MLC has been registered in a dispensary or hospital, a fresh registration is not required in the institution, the patient is referred to for further management. There is no stipulated time period beyond which a medico-legal case cannot be registered.<sup>2</sup>

The cases treated as medico-legal cases are all cases of road traffic and roadside accidents, accident or unusual occurrences in a factory, all cases of serious Injury, suspected homicidal injuries, suspected self-inflicted injuries, suspected attempts at suicide, burn Injuries due to any cause, suspected or evident poisoning, any injury where foul play is suspected, and the injured appears to be either a victim or the culprit in a criminal case, suspected or evident sexual offences, suspected or evident criminal abortions, suspected or evident child abuse, suspected or evident intimate partner abuse, unconscious patients where the cause of unconsciousness is not clear, cases brought dead to hospital with improper, inadequate and incomplete history, cases referred by the police or a court of law for some specific legal or medico-legal requirement.<sup>2</sup>

All medico-legal reports and related documents should be kept under the custody of the Officer in charge of the Casualty till they are completed. Thereafter, the records section of the hospital should maintain these records. These records are required for giving subsequent opinion and for production in a court of law when required.<sup>2</sup>

In a study conducted at Government Wenlock District hospital Mangalore, Karnataka from January 2002 to December 2002, a total of 465 medico legal cases were analyzed. Out of 465 cases, 393 (84.5%) recovered and 72 (15.5%) died. Males 364 (78.3%) out numbered females 101 (18.1%) with the ratio of 3.6:1. Maximum number 89 (19.1%) of cases were in the age group of 25-30 years, where as minimum 4 (0.9%) in 5-10 years age group. Maximum number of cases 125 (26.8%) occurred between 6am – 12noon and least 58 (12.5%) cases between 12am – 6am. Alcohol consumption was present in 82(17.6%) cases. Road traffic accidents constituted the maximum 161 (34.6%). Out of 161(100%) RTA, Pedestrians 97(60.2%), two wheelers 38 (23.6%), four wheelers 26 (16.2%). Most of the RTA were during rainy season 78 (48.5%), maximum of cases 45 (27.9%) noticed between 6am -12noon and least 21(13.04%) between 12am-6am. RTA was followed by Assault cases 144 (30.9%), males 121 and females 23 with the ratio of 5.3:1. Out of 144(100%) assault cases, 86 (59.7%) of blunt force injuries, 55 (38.2%) of sharp weapon injuries and 3(2.1%) of fire arm injuries. There were 87 (60.4%) cases of grievous and 57 (39.6%) of simple injury. Poisoning cases were 104 (22.4%), males 81 (77.9%) and females 23(22.1%) with the ratio of 3.5:1. Out of these 104 (100%), Organophosphorus 43(41.4%), food 12(11.5%), Kerosene 8 (7.7%), Snake 6(5.8%) Alcohol 6(5.8%), Sedative 5(4.8%), Corrosives 4(3.8%), plant source 3 (2.9%) and others 17(16.3%). There were total of 52(11.2%) burns cases, female 32 and males 20 with the ratio of 1.6:1. Out of these 52 (100%) burn cases, superficial burns 23 (44.2%), superficial to deep burns

18(34.6%) and deep burns 11(21.2%). There were total 4(0.9%) cases of drowning, out of the 4(100%) drowning, 1 (25%) was of well and 3 (75%) were of sea water drowning.<sup>3</sup>

**Road Traffic Accidents:**

Road Traffic Accident (RTA) is any vehicular accident occurring on the roadway (i.e. originating on, terminating on, or involving a vehicle partially on the roadway).<sup>4</sup>

Road Traffic Accidents are as old as roads. They must have started taking place since the vehicle started playing on roads. The first death due to a motor vehicle was registered in 1896 in the United Kingdom and the second one in the USA in 1899.<sup>5</sup>

In the study conducted at Department of Forensic Medicine, University college of Medical sciences and GTB hospital, Shahadra, Delhi during the 1 year period 1999-2000, a total of 110 RTA victims were studied. Males outnumbered females in the ratio of 9:1. The maximum number 41 (37.3%) victims were in the age group of 21-30 years, followed by 21 (19.1%) in the age group of 11-20 years. The minimum number 01 (0.9%) was seen in >70 years age group. Maximum number of accidents occurred between 6.01 pm- 12.00 midnight with 30.9% cases, followed by 28.1% cases between 12.01 pm- 06.00 pm and minimum number 19% cases between 06.01 am-12.00 noon. Majority of the accidents 36 (32.7%) cases occurred in summer months, followed by spring 33 (30%) cases and rainy season with 22 (20%) cases. The least 19 (17.2%) cases were seen in winter. It was found that pedestrian form the largest group of 57.3% victims followed by motorcyclist 21.9% victims and bus/truck victims 13.6%. The least number of victims was those involved in car/van with 4.5%. Majority 46 (41.8%) victims died due to shock as a result of hemorrhage, followed by 22 (20%) due to head injury and 24 (21.8%) died due crush injury of head.<sup>6</sup>

In another study conducted at the Sunsari district hospital, Ineruwa and the B.P. Koirala institute of health sciences hospital, Dharan during the one year period from May 1997 to April 1998, a total of 870 RTA victims were studied. There were 662 (76.1%) males and 208 (23.9%) female victims. Majority of the victims 249 (28.6%) were from 20-29 years of age, followed by 164 (18.9%) victims in the age group of 30-39 years. More than 80% of victims were under 40 years of age. An equal percentage 23% of victims was either illiterate or had only primary level education. Victims with a higher education were few in proportion. Maximum number of victims 240 (27.6%) were laborers, followed by students 209 (24.1%), house wife 104 (11.9%), agriculturist 71 (8.1%) and government service 51 (5.9%). The unemployed were 48 (5.6%). A greater number of accident cases 37% were registered in rainy season, followed by 33.5% in winter months and 30.5% cases in summer. It was noticed that the categories of road users involved in these accidents were occupants of different vehicle 46%, drivers 24.4% and pedestrians 29.6%. Among the drivers of different type of vehicles, 80 (37.7%) were bicyclist, followed by 70 (33%) motorcyclist.<sup>7</sup>

In a study conducted at Municipal Corporation of Delhi, a total of 680 traffic injury cases per 1000 population were analyzed during 2002. The incidence of traffic injury per 1000 population was high in the age group of 15 to 55 years, but the total numbers of injuries were more in the age group of 15 to 35 years (69% i.e. 470 out of 680 cases). It was noted that the higher incidence of traffic injury was seen in business group (44%), followed by service group (40.1%) and in labor group (28.9%) cases. The majority of traffic injuries were highest among people with an education level corresponding to 6<sup>th</sup> or 8<sup>th</sup> class. It was observed that the most affected parts of the body in majority of traffic injuries were limbs (62.2%), followed by head with

11.2%). The maximum number 387 cases of injuries occurred in July, August and September. The majority of 146 cases occurred between 15-18 hours, followed by 123 cases between 12-15 hours and 117 cases between 18-21 hours. The most common injuries were seen among the occupants of two-wheelers (46.3%) and pedestrians with 24.9%.<sup>8</sup>

Another study conducted at JIPMER, Pondicherry from 1<sup>st</sup> January to 31<sup>st</sup> December 1994. A total of 726 reported road traffic accident victims were analyzed. There were 603 (83%) males and 123 (17%) female. The maximum number of victims 516 (71%) were under 40 years of age. The occupants of the various vehicles constituted the large group (45%) of victims. The laborers 217 (29.9%) were in the major group among the victims, followed by the persons who were employed in service 157 (21.6%). The highest number of road traffic accidents took place in January (12.9%) followed by August and October (9%). The maximum number of accidents took place on Sundays (17.1%) and least on Mondays (12.3%).<sup>9</sup>

A study conducted at Government District Wenlock hospital, Mangalore, Karnataka from 1<sup>st</sup> January to 31<sup>st</sup> December 2002, a total of 165 cases of RTA were analyzed. There were 138 (85.7%) males and 23 (14.3%) female victims. Maximum number 41 (25.5%) victims were in the age group of 20-30 years, followed by 35 (21.7%) in 30-40 years, 32 (19.9%) victims in 40-50 years age group and least 2 (0.2%) victims were seen in age above 70 years. It was seen that maximum 54 (33.5%) cases occurred between 06.01 pm – 12.00 mid night and minimum 21 (13%) cases occurred at night between 12.01 am – 06.00 am. Majority 78 (48.5%) cases occurred in rainy season, followed by 54 (33.5%) in winter and least 29 (18%) cases in summer season. It was observed that 97 (60.2%) victims were pedestrians, 38

(23.6%) victims were riding two wheelers and 26 (16.2%) victims were driving four wheeler.<sup>10</sup>

In the study conducted in 2003-2004 at Department of Forensic Medicine, SMS Medical College, Jaipur, a total of 120 cases of fatal head injury were analyzed. Out of these 79 (65.8%) cases were RTA and 28 (34.2%) were others. Males (79.8%) were more prone to death by RTAs as compared to (20.2%) females in a ratio of 4:1. The peak timings of RTA were either 09.00 am – 12.00 pm or 06.00 pm -09.00 pm. The incidence of deaths due to RTAs was maximum (49.37%) in two wheeler riders, followed by pedestrian in (32.91%) cases. Four wheelers were involved in (15.19%) cases and bicyclist in (5.53%) cases.<sup>11</sup>

In another study conducted at Kasturba Hospital of M.G.I.M.S., Sevagram, Wardha, Maharashtra from July 1999 to June 2000, a total of 125 RTA cases were studied, of which 32 cases died and autopsied. The males 104 (83.20%) cases outnumbered females 21 (16.80%) with the ratio of 4.9:1. The maximum incidence was in the age group of 20-29 years comprising 39 (31.20%) cases followed by 30-39 years age group having 34 (27.20%) cases. It was noted that the pedestrian were the commonest group of victims comprising 55 (44%), followed by driver 41 (32.80%) cases and occupants in 29 (23.20%) cases. The head was the commonest site involving 67 (53.56%) cases, followed by lower limb 52 (41.60%) cases. Among the autopsied 32 cases, the commonest age group was 20-29 years. The commonest cause of death was head injury 18 (56.25%) cases, followed by hemorrhage and shock with injury to internal organs in 06 (18.75%) cases.<sup>12</sup>

Another study conducted at Manipal teaching hospital, Pokhara, Nepal, from 1<sup>st</sup> June 2004 to 31<sup>st</sup> May 2005. A total of 360 RTA victims were studied. Mobile males (85%) outscored the domicile females (5%). Majority of the cases 138 (38.33%) were

in the age group of 15-30 years. The victims from rural areas 237 (65.83%) were more as compared to urban areas 123 (34.17%). High prevalence of RTA was reported in school educated i.e. 177 (49.16%) and graduates 141 (39.15%). The people from middle and low socio-economic class were more affected 198 (55%) and 114 (31.66%) cases respectively. Out of 360 cases, 153 (42.50%) were passengers, 105 (28.16%) pedestrians, 69 (19.17%) drivers and 33 (9.61%) were cyclist. Majority 159 (44.16%) of the accidents occurred between 3 and 7 pm, followed by 87 (24.16%) between 7 and 11 pm. It was noticed that majority 269 (81.66%) of RTAs occurred in rainy and cloudy condition. Out of 360 cases, 156 (43.32%) sustained head injury.<sup>13</sup>

In a study was conducted in Krishna Hospital and Medical Research Centre, by the Department of Preventive and Social Medicine from 1 May 2003 to 30 April 2004, a total of 350 cases of road traffic accidents were studied. Males 288 (82.3%) outnumbered females 62 (17.7%) cases. The average age of victims was 32.5 years. Majority of 103 (29.4%) victims were between 20 -29 years of age. Of 174 (49.7%) occupants, motorized two-wheeler occupants were highest in number, i.e. 61 (35%) followed by occupants of four wheelers 45 (25.9%), other occupants were from truck 27 (15.5%), three wheelers 19 (10.9%), tractors 10 (5.7%), tempos 4 (2.3%), bullock carts 4 (2.3%), bicycles 3 (1.7%) and bus 1 (0.6%). A total of 129 drivers were involved, among them 79 (61.2%) motorized two-wheeler drivers and 26 (20.1%) bicyclists. Truck drivers were three (7%), whereas bullock cart, three-wheeler and tempo drivers were two (1.6%) each. Tractor drivers were three (2.3%), four-wheeler drivers were five (3.9%) and bus drivers were one (0.8%).<sup>14</sup>

Another study carried out at Indira Gandhi Medical College, Nagpur, during the year 1999-2000, a total of 423 victims of road traffic accidents were studied. Out of

total 423 subjects, 363 (85.8%) were males and 60 (14.2%) were female subjects. Thus a male: female ratio of 6:1 was observed. It was seen that majority of the victims were in the age group 18-37 years constituting about three fourth of the study victims. Two wheelers and light motor vehicles were the common vehicle being involved in accidents (69.97%) and the accidents were more common during the daytime. The most common body region affected by injury was lower extremity in 192 (45.3%) cases and multiple sites in 114 (26.95%) cases.<sup>15</sup>

### **Fall from Height:**

Fall is an event which results in a person coming to rest inadvertently, on the ground or floor or other lower level as per World Health Organization.<sup>16</sup> Falls may be accidental, suicidal or homicidal, however, among these accidental falls are encountered more commonly.

As per National Crimes Record Bureau of India, fall from height accounted for 2.6% of accidental deaths and for 2.8% of accidental deaths due to un-natural causes in India in the year 2008.<sup>17</sup>

In a study conducted at Berufsgenossenschaftliche Kliniken, Bergmannsheil, Bochum, Germany from 1987-1990, a total of 101 adult fall from height patients were studied in respect to pattern of injury. The most common injuries were fractures of the thoracic and lumbar spine (83.0%) with a preference for the thoracolumbar junction. Fracture of the lower limbs occurred in 45%. The most frequent injuries were fractures of the os calcis (64.4%) and the ankle joint (26.6%). Twenty-five percent of all patients suffered from fractures in the upper limbs with a preference for the distal radius (56.6%) and the elbow (44.0%).<sup>18</sup>

Another study conducted at Kempegowda Institute of Medical Science, Bangalore, a total of 80 fatal fall from height cases were studied in the year 2005. The majority of

the victims were male, aged between 20-30 years and laborers by occupation. Most of them fell from a height of 0-10 feet. The head is the most common vulnerable structure with fractures of the vertex.<sup>19</sup>

In the prospective study conducted in 2006 at Department of Emergency Medicine, Gaziantep University Faculty of Medicine, Gaziantep, Turkey, 538 patients who sustained injuries after an accidental fall from heights were studied over a seven-month period entered into the study. Males had a higher rate of falls from height than females. 83.5% cases were under 20 years and the most common injuries were to the head, and 100% of those who died had a head injury. It was seen that cranio-cerebral injury was the most common injury in fatal falls.<sup>20</sup>

In a retrospective analysis of cases of falls from heights between June 2007 and May 2008 at the accident and emergency center of the university of Benin teaching hospital, Nigeria, 84 patients aged between 1 and 60 years were studied. Males 54 cases outnumbered females 30 cases with a male: female ratio of 1.8:1. All the falls were accidental and occurred mainly among males aged between 18 and 30 years, with a peak incidence between March and May. Falls from moving vehicles 13 (15.5%); off the top of buildings at construction sites, eight (9.5%), staircase, six (7.1%); and treetops, six (7.1%) were common.<sup>21</sup>

### **Poisoning:**

A poison is any substance, which, when introduced into the living body or brought into contact with any part thereof, will produce ill effects or death by its local or systemic action or both.<sup>22</sup>

WHO defines, Drug is any substance or product that is used or intended to be used to modify or explore physiological systems or pathological states for the benefit of the recipient.<sup>22</sup>

In a one year retrospective study, conducted in a southern district of Sri Lanka in 1988 on pattern of suicide, there were 223 cases of suicide, in which the most preferred method of suicide was by ingestion of a poisonous substance seen in 182 (81.8%) cases. Commonest poison consumed was Agrochemicals, accounting for 161 (88.4%) cases, followed by plant poison (3.8%) and unknown poison (5%). Largest numbers of suicides were seen in the age group of 15-24 years. Male to female ratio, in consumption of poison, was almost equal (81.5%, 81.8%).<sup>23</sup>

In a retrospective study of 4 years conducted between 1991-1995, at B.K. Hospital, Faridabad, Haryana, 189 case files of poisoning were analyzed. It revealed male: female ratio 3:1 and commonest age group involved was between 13-25 years (49.2%). The manner of poisoning, in maximum number of cases (56.08%) was suicidal, the commonest agent used being Aluminium phosphide (70.73%) and farmers being highest victims (35.5%).<sup>24</sup>

A study conducted at M.K.C.G. Medical college hospital, Behrampur, Orissa from September 1999 to august 2001, a total of 306 (100%) cases of poisoning were studied. Males 163 (53.3%) dominated the females 143 (46.7%) with the ratio of 1.14:1. The maximum number of victims 124 (40.5%) were in the age group between 21-30 years and the least number 5 cases (1.6%) were aged above 50 years. Most of the victims 256 (83.7%) were from medium socio-economic status. The geographical distribution showed that rural incidence 178 (58.2%) over took the urban incidence of 128 (41.8%). In respect to the incidence of literacy status of the victims the literates were more in number 257 (83.9%) compared to illiterates 49(16%).totally 156(51%) were married. Maximum cases 97 (31.7%) were recorded in summer season followed by 85 (27.8%) in rainy season and least 54 (17.6%) in winter. The total of 171

(55.9%) victims consumed poison between 6am-6pm and the most abused poison was Organophosphorus.<sup>25</sup>

A 5 year retrospective study was conducted at Government Wenlock Hospital, Mangalore, from 1<sup>st</sup> January 1999 to 31<sup>st</sup> December 2003. A total of 546 cases were admitted due to acute poisoning during the study period. Out of 546 cases, 380 (69.6%) were males and 166 (30.4%) were females. Majority of poisoning was suicidal 361 (66.12%) cases; followed by accidental in 184 (33.7%) cases and homicidal was seen in just one case. Majority of the victims were in the age group of 21-40 years (53%). Pesticides were the commonest agents abused in 195 (35.7%) cases. 19 % of the victims of suicidal poisoning lost their lives whereas only 9.8% of the victims of accidental poisoning succumbed. In toto 15.7% of total poisoning cases admitted to the hospital expired.<sup>26</sup>

A one year study conducted at Civil Hospital, Belgaum, in 2000-2001, revealed a total of 290 cases admitted with proper history of poisoning. Out of these 151 cases (60.4%) were due to Organophosphorus poisoning in which 47 expired (31.12%), followed by medicinal drugs 44 cases (17.06%) in which 6 cases (13.6%) expired. The commonest age group involved was 20-29 years (40%). The male to female ratio was 2.8:1. Suicidal poisoning (67.74%) were commonest and largely seen among agriculturists (63.6%). The overall mortality was 30.69% and that due to agrochemicals was 72%.<sup>27</sup>

In a study conducted in Department of Forensic Medicine at Shri M.P.Shah Medical College, Jamnagar, Gujarat, during 2003-2004, a total of 826 autopsies were conducted. Out of total 826 cases, 132 (15.98%) of poisoning were detected. The incidence of poisoning was more in second (24.2%) and third decade (43.1%). The males were more prone to death (62.1%) as compared to females (37.9%). It was

noted that maximum persons were illiterate (55.3%), married (57.6%) and from lower socio-economic status (87.1%). The incidence was more common in rural areas (62.8%) and common in farmers (28.8%). The incidence of suicidal cases was highest (68.2%), followed by accidental poisoning (31.1%). The insecticide was the most common poison (22.7%), followed by snake bite poisoning (12.9%) and aluminum phosphide poisoning (4.5%).<sup>28</sup>

In a prospective study conducted at Al-Ameen Medical College Hospital, Bijapur, during 2004-2005, a total of 229 poisoning cases were analyzed. The Majority of victims were males (57.15%) and male: female ratio was 1.3:1. Most of the victims were in the age group of 21-30 years and the commonest type of poison encountered was the compounds of Organophosphorus (73.14%). Suicidal poisoning (77.33%) were commonest and largely seen among agriculturists (36%), followed by laborers (23.43%). It was noted that maximum persons were from lower socio-economic status (72.57%). The incidence was more common in rural areas 133 (76%) cases.<sup>29</sup>

In a retrospective study conducted at St. Martha's hospital, Bangalore, during 2006-2007, a total of 148 poisoning cases were analyzed. The Majority of victims were males 93 (62.84%) and female were 55 (37.16%) cases with male: female ratio was 1.7:1. The majority of victims were in the age group of 21-40 years, followed by the age group between 1-20 years. The incidence was more common in rural areas and common in manual laborers. It was also found that the maximum 57.43% were married and the commonly consumed poison was Organophosphorus compound with 89 (60.14%) cases.<sup>30</sup>

Another study conducted Dr. Susheela Tewari Memorial Forest Hospital, Uttarakand, during 2007-2008, 350 cases of poisoning were analyzed. The majority were males 66.58% cases and male: female ratio was 1.99:1. The persons of lower

and middle class were the commonest victims 59.71% and 38.58% respectively. It was found that most of the victims were illiterate or educated upto high school and belonging to rural areas. The majority of the victims were farmers 50.29%, followed by house wife 25.27%. The most common type of poison consumed was Organophosphorus compound 67.43%.<sup>31</sup>

**Burns:**

Burn is an injury caused by heat or by chemical or physical agent having an effect similar to heat. Burns are produced by dry heat or moist heat (scalds).<sup>32</sup>

In a study conducted at the Hacettepe University Hospital, Ankara, Turkey during 1979 to 1991, a total of 1005 patients were admitted to the burns unit. Of these, 66.3% were males and 33.7% were females. Flame injuries and scalds accounted respectively for 52.5% and 44.3% of the injuries. Electrical burns accounted for 2.1%. The overall mortality rate was 34.4%.<sup>33</sup>

In an analysis of 629 burn patients treated between January 1989 and August 1990 in SMS hospital, Jaipur, India, it was observed that adolescent and young adults (11-40 years) comprised 64.8% of the patients. The males 54% outnumbered females 46%. Flame burns comprised 67.9% and scalds comprised 16.4% of the total burns. The overall mortality rate was 48.3%. Flame burns resulted in maximum deaths 62.1%. In patients with over 40% burns, the mortality rate was about 80%. There were no survivors in patients with over 70% TBSA burns in this study.<sup>34</sup>

In a prospective study conducted at Department of Burn and Plastic Surgery, BJ Medical College, Ahmedabad during the year 1991, a total of 498 burn admitted cases were studied. The female 223 cases were more affected than males with 163 cases, an overall sex ratio of 1.4:1. Flame burns were the commonest 328 (85%) cases followed by electrical burns 37 (9.5%). The flame burns were common in females whereas

electrical, chemical and friction burns were more common in males. Majority 75% of total burn cases were in the age group of 20-34 years. Maximum number of 197 (51%) cases took place between 6 am – 02.00 pm, followed by 2 pm – 10 pm with 142 (36.8%) cases. The maximum number 96 (24.9%) cases had TBSA (total body surface area) between 20-39%, followed by 94 (24.3%) had 80% or more of TBSA and least 50 (13%) with less than 20% burnt TBSA.<sup>35</sup>

Another study conducted at Alexandria Main University Hospital, Egypt during 1996, it was found that male: female ratio being 1.1:1. The majority of cases 86.7% were under 40 years of age and most females 64% were found in the married group and more males 63% in the single group. The majority of burn injuries 91.4% occurred in the home and flame represented the most common agent of burn injuries 66.8%, affected more in females and the kerosene stoves in 53.2% were the most common source. The clothing ignition was reported in 82.9% of flame burn patients and 61% of them were females. The most of the cases were either mixed second and third degree burns or isolated second degree with 49.25 and 44.3% respectively.<sup>36</sup>

In a retrospective study conducted on 1160 patients of acute burns admitted through casualty to the burns ward of plastic surgery unit of J.N. Medical College and Hospital, AMU, Aligarh (UP) from 1<sup>st</sup> May 1997 to 31<sup>st</sup> December 2002, it was found that most of the patients were in 13-25 years age group, followed by 26-39 years. The females outnumbered males in all types of burns (female: male = 1.17: 1). The majority 75% of the accidents were due to flame, 10% scalds, 14.1% electrical and 0.9% chemical burns. Maximum number of deaths occurred in patients with a TBSA of more than 50-60%. Most common cause of death was sepsis 165 (54%) cases, followed by multiple organ failure 57 (18.16%) cases, burn and inhalation injury 50 (16.4%) cases and burn shock with 34 (12%) cases.<sup>37</sup>

In a study conducted at M.Y. hospital, Indore during 2005-2006, a total of 412 admitted burn patients were analyzed. It was observed that the females 70.3% outnumbered the males 29.7% and most of the cases were between 21-30 years of age. The most of the cases 62.3% were from rural areas as compared to 37.7% urban. The majority 85% of burn injuries occurred at home and flame 75.1 were the most common agent of burn injuries. Among flame burns, kerosene stoves were the most common source. The most common manner of burns was accidental in 67.7%. The majority of the cases belonged to third degree burns 64.6%, while the rest 35.4% were first and second degree burns. The case fatality rate was 62.4% and the commonest cause of death was due to septicemia.<sup>38</sup>

In a study conducted at Jawaharlal Nehru Medical College, Hospital, Aligarh Muslim university, Aligarh, during the period from 1<sup>st</sup> July 2005 to 31<sup>st</sup> July 2007, a total of 403 burn cases were studied and it was observed that the female 214 (53.1%) cases outnumbered the males 189 (46.9%) with the ratio of 1.13:1. The maximum number of cases 167 (41.5%) were in the age group of 13-25 years and the least number 5 cases (1.2%) was seen in aged persons more than 60 years. The rural cases 276 (68.4%) dominated the urban 127 (31.6%) cases. As per the marital status, it was found that 292 cases (72.5%) were married and 117 (27.5%) were unmarried. It was observed that 130 cases (32.3%) had burns due to kerosene stove, followed by flame (chulla) 93 (23.5%), electrical burn 66 (16.4%), kerosene lamp 57 (14.2%) and with hot liquid 25 (6.2%). The maximum number 131 (32.5%) cases had TBSA (total body surface area) burnt percentage up to 25%, followed by 116 (28.8%) with 26-50% of TBSA and least 67 (16.7%) with 51-75% burnt TBSA. There was mortality of 105 (26%) cases, of which females 71 (67.6%) and males 34 (32.4%) with the ratio of 2.09:1.<sup>39</sup>

In a prospective study conducted at Government Teaching Hospitals in South India, a total of 150 burn cases were analyzed. There were 62 males (41.3%) and 88 females (58.7%). The majority of the burn cases were in the age group of 15-34 years. The flame burns accounted for 86.6% and accidental flame burns was the commonest cause in 57%. Kerosene stoves contributed to 48% of accidental burns when compared to 2% due to gas stoves. The majority of the patients who sustained burn injuries had TBSA between 25-50%. Out of 150 patients, 86 died with an overall mortality of 57.33%.<sup>40</sup>

### **Assault:**

Whoever makes any gesture, or any preparation intending or knowing it to be likely that such gesture or preparation will cause any person present to apprehend that he who makes that gesture or preparation is about to use criminal force to that person, is said to commit an assault.<sup>41</sup>

In a retrospective study conducted at Department of Forensic Medicine and Toxicology, M. P. Shah Medical College, Jamnagar during 2000-2004, a total of 179 cases of homicidal deaths were subjected for postmortem. Out of which, deaths associated with fatal head injuries were observed in 64 cases and the remaining 115 cases were excluded. The maximum number 26 (40.63%) of head injury cases was seen in the age group of 21-30 years, followed by 12 (18.75%) cases were seen below 10 years of age. The commonest method or weapon used was blunt in nature with 45 (70.13%) cases, followed by the use of sharp and blunt weapons in 11 (17.19%) cases.<sup>42</sup>

In a study conducted at KLE's Prabhakar Kore Hospital and Research Centre, Belgaum, during 2003-2008, a total of 28 homicidal deaths were studied which were booked under Sec. 302 IPC. It was observed that the males outnumbered females in

the ratio of 6: 1 and maximum number of deaths was seen in the age group of 21-40 years. The majority of deaths were seen in rural areas and the highest number of cases was sharp weapon injuries, stab injuries were the commonest type in sharp cutting weapon.<sup>43</sup>

Another study conducted at Forensic Medicine Department, Regional Institute of Medical sciences, Imphal, Manipur during 2005-2007, a total of 892 postmortem examinations were conducted and 475 (53.6%) were of homicidal deaths, of which 30 (6.27%) cases were caused by blunt force injury and the same was studied. It was observed that male: female ratio was 14:1 and commonest amongst age group of 31-40 years (30%), followed by age group of 21-30 years (26.7%). The majority in 25 (83.3%) cases, there was involvement of head and neck and contusion was the most common type of external injury. The most common cause of death was head injury seen in 18 (60%) cases, followed by shock and hemorrhage in 11 (36.7%) cases and injury to vital organs in 1 (3.3%) case.<sup>44</sup>

A study conducted at GCS Medical College, Faridkot during the period from July 2006 to September 2007 and a total of 100 victims who sustained injuries with sharp weapons were studied. The incidence in males 94 (94%) was 15 times more than in females 6 (6%). The maximum 58 (58%) of incidence were in the younger age group of 21-40 years, followed by 28 (28%) in middle aged generation and minimum 2 (2%) of incidence was seen in older age group aged above 60 years. In majority of cases, it was observed that the type of weapon used was light sharp in 92% cases, heavy sharp in 7% and pointed weapon in 1% of cases. The simple injuries accounted to 80% of cases, eight times higher as compared to grievous injury 10%. Upper limbs (47%) were the parts of the body with injuries in majority of cases followed by head (17%) and mixed type (14%). Nature of injury was homicidal in 60% of cases

---

followed by fabricated or strongly suspected fabricated injuries 34% and 6% cases as dangerous.<sup>45</sup>

**Bites and stings:**

Humans can be injured by the bites and stings of many kinds of animals, including mammals such as dogs, cats, and fellow humans; arthropods such as spiders, bees, and wasps; snakes; and marine animals such as jelly fish and string rays.<sup>46</sup>

In a study conducted at UCLA Hospital emergency department during 1975, a total of 307 bite injuries were analyzed. Dog bites were almost twice as common among men, while cat bite-scratches were twice as common among women. 43% of dog bites and 52% of cat bites-scratches were provoked, that is, happened while the victim was interacting with the animal. Of bites of the head and/or neck, 38% injured the upper lip, 17% of the dog bites injured the eye or adjacent tissue and 48% were in children less than 10 years old. One fifth of cat bites-scratches involved the head and/ or neck and 60% of these injured orbital and periorbital tissues.<sup>47</sup>

Another retrospective study conducted Khuzestan Health Centre, south west, Iran during 1997-2006, a total of 894 patients of bites and stings were analyzed. The males 62% were more affected than females in 38%. The median age of males and females was 24.4 years and 26.2 years. The dog, scorpion, mouse and snake bites were the most common with frequencies of 69%, 12.6%, 8.8% and 4.4 respectively. The incidence was more common in rural areas with 622 cases as compared to urban with 272 cases. The feet 58.1% and hands 30.6% were the most commonly affected parts, followed by face and other parts. The dogs, scorpions and snakes frequently affected the foot with a rate of 60-70%, where as cats and mice affected the hand with a frequency of 40-45%. The multiple bites and injuries were observed to be caused by cats and dogs with a frequency of 20% and 8% respectively.<sup>48</sup>

In a retrospective study conducted at Community Health Centre of Himachal Pradesh, during 2006-2007, a total of 30 cases of animal bites were analyzed. The females 56.7% outnumbered males 43.3%. The majority 46.6% of bites was due to wasp/ bee bite followed by snake bite and dog bite of 20% each. The most 66.6% of dog bite cases were observed in the age group of 6-15 years, while 100% snake bite was observed in age more than 15 years. The majority of victims were seen from rural areas 76.7% as compared to urban with 22.3% cases.<sup>49</sup>

### **Mechanical Asphyxia:**

It may be taken to mean that the flow of air into the body is interfered through some physical impediments.<sup>22</sup>

In a retrospective study conducted at Department of Forensic Medicine, Kasturba Medical College, Manipal, India, during 1992-2007, a total of 513 suicide cases were analyzed. Out of which, 84 cases were suicidal deaths due to hanging, 38 victims belonged to 21-40 year age group. The male victims 57.1% outnumbered female victims with 42.9%. The incident occurred more during day time and was common in winter months. The psychological stress was the predominant motive responsible for suicide.<sup>50</sup>

Another retrospective study conducted at Department of Forensic Medicine of All India Institute of Medical Sciences during 1996-2005, a total of 256 accidental asphyxia deaths were analyzed. The male victims outnumbered females in a ratio of 5.09:1. The most common age group involved in both sexes was 20-29 years (33.6%), followed by 10-19 years (20.7%). Among the different modes of asphyxia deaths, drowning (57.4%) was the most common, followed by choking and aspiration (16%),

traumatic asphyxia (12.9%) and carbon monoxide poisoning (9.4%). It was observed that drowning deaths mostly occurred during rainy season.<sup>51</sup>

Strangulation is a type of mechanical asphyxia due to constriction of neck by force applied other than by the weight of the body. Accidental causes of strangulation are rare.<sup>22</sup> In the literatures, accidental strangulation has been reported commonly in children and old aged individuals. However, among adults it is seen commonly in those individuals who were either intoxicated or engaged in paraphilic activities.

In a study on accidental strangulation deaths conducted at Department of Forensic Medicine at University College of Medical Sciences and GTB Hospital, Delhi during 1993-2004. A total of 98 cases of strangulation deaths were autopsied, 5 (5.1%) of them were accidental strangulation when compared to 93 (94.9%) cases of homicidal strangulation. The overall incidence of accidental strangulation was 0.06%. The victims were between the age 16 and 50 years and 80% of the victims were females and 20% was male. This is because females in this region wear the traditional loose clothes such as chunni or dupatta, travel in cycle rickshaws commonly and got themselves strangulated accidentally. All the cases occurred during day time especially in the morning. Two of the five cases died by the time they were admitted to the hospital. There were no associated injuries in the three cases except for the ligature mark around the neck.<sup>52</sup>

## **METHODOLOGY**

The present study was a cross-sectional study. The study material comprised of all medico-legal cases which were registered at KLES'S Dr. Prabhakar Kore Hospital and MRC, Belgaum, during 1 year period from 1<sup>st</sup> January 2009 to 31<sup>st</sup> December 2009.

The sample size was estimated to be 1500 cases by taking 80% of the average of similar cases, in KLES'S Dr. Prabhakar Kore Hospital and MRC, Belgaum, over a period of 3 years (January 2006 to December 2008) and this was covered during the said period.

Ethical clearance for the present study was obtained from the Institutional Ethical Committee, J. N. Medical College, Belgaum.

In the present study, information regarding the bio-data of the victim like age, sex, marital status, occupation, domicile, educational status, socio-economic status, time and place of incident were gathered by interviewing the patient or patient's attendants (parents, guardian, relatives, friends, etc.) either in casualty, trauma center or in the wards of the hospital. The medico-legal records and case sheets were also referred for additional information. The data thus obtained was recorded in the pre-designed and pre-tested proforma, which comprised relevant data that is concerned with the objectives of the study and analyzed.

### **Inclusion criteria:**

All cases which were registered in medico-legal register of K.L.E.S'S Dr. Prabhakar Kore Hospital and MRC, Belgaum.

Informed written consent was taken from the patient or legally authorized person according to patient's condition and age. (In case of children < 12 years, consent was obtained from parents or guardians)

Age of the deceased was calculated as to the nearest completed year. The age groups of victims were categorized in an interval of 10 years. The cases were divided into 4 time slots as to the time of incident i.e. morning (6.01 am to 12 pm), afternoon (12.01pm to 4 pm), evening (4.01 pm to 8 pm) and night (8.01 pm to 6 am). Depending upon the season in which the incident occurred, the cases were grouped into three i.e. summer from month of February to May, rainy from month of June to September and winter from month of October to January.

The Socio-economic status of victim was classified according to modified B.G. Prasad classification (2008) <sup>53</sup> based on per capita incomes in Rupees per month, into 5 classes. Per-capita monthly income of the family was calculated by dividing total monthly income of the family with family size.

<b>Socioeconomic class</b>	<b>Prasad's classification 1961 per capita income in Rs./ Month</b>	<b>Modified Prasad's classification in the study period 2009. Per capita income in Rs. / month</b>
I	100 & above	3600 & Above
II	50 – 99	1800 & 3599
III	30 –49	1080 & 1799
IV	15 – 29	540 & 1079
V	below 158	<540

Average consumer price index for the year 2009 = 727

Modification was done with the aid of Multiplication Factor, which was obtained as below:

$$\begin{aligned} \text{Multiplication Factor} &= \frac{\text{Average Consumer price index for study period}}{100} \times 4.93 \\ &= 727/100 \times 4.93 = 35.8 \end{aligned}$$

The Domicile status was grouped into urban and rural. The urban area or towns are places which either have a municipality or a cantonment or have been treated as town because they have a population more than 5000 and or 75% or more male workers are engaged in non-agricultural occupation.<sup>54</sup>

The manner of incident into accidental, suicidal and homicidal based on the history given by the patient, patient's relatives and police information. In the present study, the Medico-legal cases were categorized into road traffic accidents, burns, poisoning, assault, fall from height, bites and stings, mechanical asphyxia and others (include fall of weight, machine injury, animal gore/hit, sudden onset of abnormal behavior and criminal abortion).

**Road Traffic Accidents:**

The RTA victims were categorized into pedestrian, pedal cyclist, motor cyclist, occupants of motor vehicle and occupants of animal drawn vehicles like bullock cart, tanga etc. Occupants of the motorcyclist were further classified into rider and pillion rider. Occupants of the motor vehicle were further classified into driver, front seat passenger and rear seat passenger. The offending vehicles were divided into pedal cycle, motor cycle, motor vehicle, animal drawn vehicle, others (self fall, stationary objects like wall, tree etc) and unknown (vehicles that could not be traced).

The motor vehicles were classified according to Motor Vehicles Act of 1985 of India<sup>55</sup> into, Light Motor Vehicles e.g. auto rickshaw, car, jeep, taxi etc., Medium Motor Vehicle e.g. matador, tempo, van, tractor etc. and Heavy Motor vehicle e.g. bus, truck etc.

Pedestrian is any person involved in a vehicular accident who was not at the time of the accident riding in or on a motor vehicle, or animal drawn vehicle, or on a pedal cycle. Pedal cycle is any land transport vehicle operated solely by pedals (includes bicycle and tricycle). Pedal cyclist is any person riding on a pedal cycle or in a sidecar or trailer attached to such a vehicle. Motorcycle means two-wheeled motor vehicle, inclusive of any detachable sidecar having an extra wheel, attached to the motor vehicle. Motorcyclist is any person riding on a motorcycle or in a sidecar attached to such a vehicle.<sup>56</sup>

Light Motor Vehicle means any public or private transport vehicle (passenger or goods) of unladen weight not exceeding 7,500 kgs, e.g. auto rickshaw, car, jeep, taxi etc. Medium Motor Vehicle means any public or private transport vehicle (passenger or goods) of unladen weight more than 7,500 kgs but not exceeding 12,000 kgs, e.g. matador, tempo, van, tractor etc. Heavy Motor Vehicle means any public or private transport vehicle (passenger or goods) of unladen weight more than 12,000 kgs, e.g. bus, truck etc. Animal drawn vehicle is any non-motor vehicle driven by any animal e.g. tanga, bullock cart etc.<sup>55</sup>

**Fall from Height:**

All cases of fall from height except those from animals, vehicles, burning buildings, falls into water and machinery were included in the study.

**Burns:**

In Burns cases, the causes were categorized into dry heat and moist heat (scalds). Dry heat includes flame, electricity, lightening, chemicals, hot objects and radiation. Moist heat includes steam, hot liquids above 60<sup>0</sup>C (water, milk, oil and molten metal).<sup>57</sup>

The percentage of Total body surface area involved is calculated by the “Rule of Nine”. According to this rule, the head and neck, front of chest, back of chest, front of abdomen, back of abdomen, right upper limb, left upper limb, front of left lower limb, back of left lower limb, front of right lower limb, back of right lower limb, each of which constitute 9% of the whole body area and pudendal area constitute 1% of the whole body area.<sup>58</sup>

In case of children the total body surface area is calculated as, head and neck 15%, front of trunk 20%, back of trunk 20%, upper limbs 20%, lower limbs 20% and genitalia 0-10% of total body surface area.<sup>58</sup>

For small burns of irregular outline in adults the burn is compared to the palm of victim’s hand which approximates 1% of total body surface area.<sup>58</sup>

The degree of burns is classified according to the Modern classification into two degrees:<sup>59</sup>

- Superficial – Here the depth of the lesion does not extend beyond part of the thickness of true skin.
- Deep – Here the lesion involves the whole depth of the true skin. All injuries involving the whole thickness of the true skin or deeper tissue are grouped in this type.

**Poisoning:**

The type of poison consumed was categorized into agrochemicals, bromadiolone, medicinal drug (benzodiazepine, phenothiazine), phenolic compounds, vegetable irritants, kerosene, heavy metal, alcohols based on clinical history given by the patient or patient attendants and the same was confirmed through Poison Detection Centre and Regional Forensic Science Laboratory, Belgaum.

**Assault:**

In Assault cases, the weapon used were categorized into hard blunt, soft blunt, sharp cutting, firearm and pointed. Based on the nature of injury the cases were classified into simple and grievous.

A. Simple Injury: <sup>41</sup> The injuries which heal rapidly without leaving any permanent deformity or disfiguration and which do not come under the category of grievous hurt.

B. Grievous Injury: <sup>41</sup> As per Sec.320 IPC, the injuries are grouped under 8 clauses.

1. Emasculation: It means loss of masculine power by:

*-Castration*

*-Cutting of penis*

*-Injury to testis*

*-Injury to spinal cord at the level of L2 to L4 vertebra.*

2. Permanent privation of sight of either eye.

3. Permanent privation of hearing of either ear.

4. Privation of any member or joint. (Member is any organ or limb of subject responsible for performing distinct function e.g. eyes, ears, nose etc.)

5. Destruction or permanent impairment of power of any member or joint.

6. Permanent disfigurement of head or face. (Disfigurement is the change in configuration or personal appearance)
7. Fracture or dislocation of bone or tooth.
8. Any hurt which endangers life or which causes sufferer to be in severe bodily pain or unable to follow his ordinary pursuits during the space of 20 days.

**Mechanical Asphyxia:**

Depending upon the cause, the cases were classified into - drowning, hanging, strangulation and suffocation.

## RESULTS

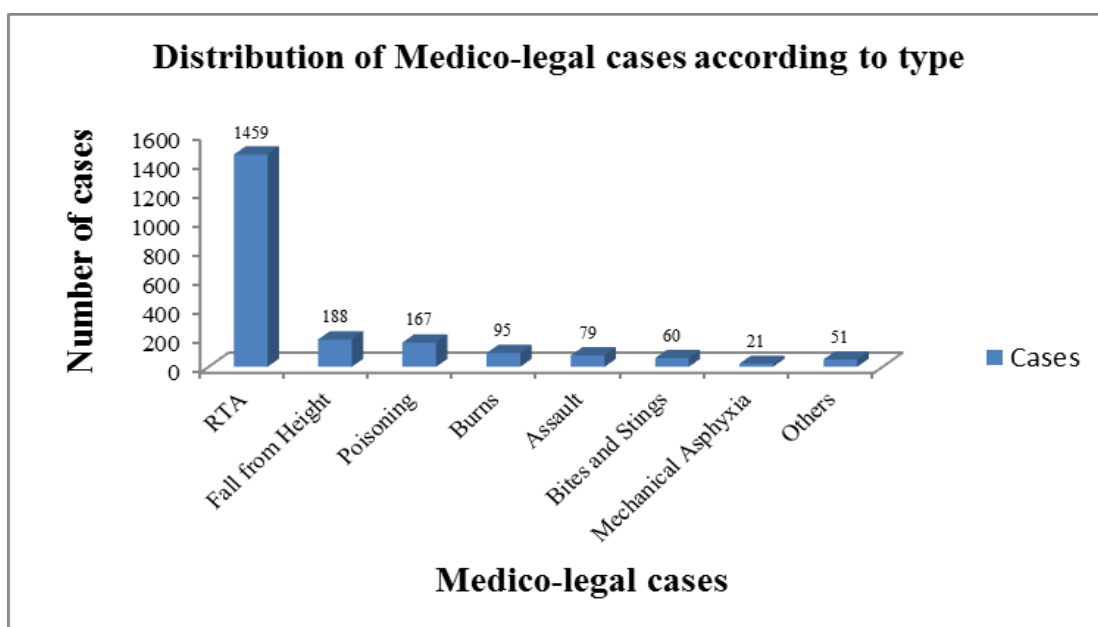

The study involved 2120 cases which were registered at casualty medico-legal register of KLES'S Dr. Prabhakar Kore Hospital and MRC, Belgaum, from 1<sup>st</sup> January 2009 to 31<sup>st</sup> December 2009.

### **Distribution of Medico-legal cases according to type:**

In the present study, RTA constituted the maximum of 1459 (68.8%) cases, followed by Fall from height 188 (08.9%) cases, Poisoning 167 (07.9%) cases, Burns 95 (04.5%) cases, Assault 79 (03.7%) cases, Bites and stings 60 (02.8%) cases, Mechanical asphyxia 21 (01.0%) cases and others 51 (02.4%) cases.

**Table 1.**

Medico-legal cases	Male	Female	Total	
			Number	Percentage
<b>RTA</b>	1164	295	1459	68.8
<b>Fall from Height</b>	142	46	188	08.9

<b>Total</b>	<b>52 (54.7%)</b>	<b>43 (45.3%)</b>	<b>95</b>	<b>100</b>

**Distribution of cases according to Degree of Burns:**

In this study, 81 (85.2%) victims had superficial burns and 14 (14.8%) had deep burns. There was not a single case in female who sustained deep burns.

**Table -25**

Degree of Burns	Male	Female	Total	
			Number	Percentage
Superficial	38	43	81	85.2
Deep	14	00	14	14.8
<b>Total</b>	<b>52 (54.7%)</b>	<b>43 (45.3%)</b>	<b>95</b>	<b>100</b>

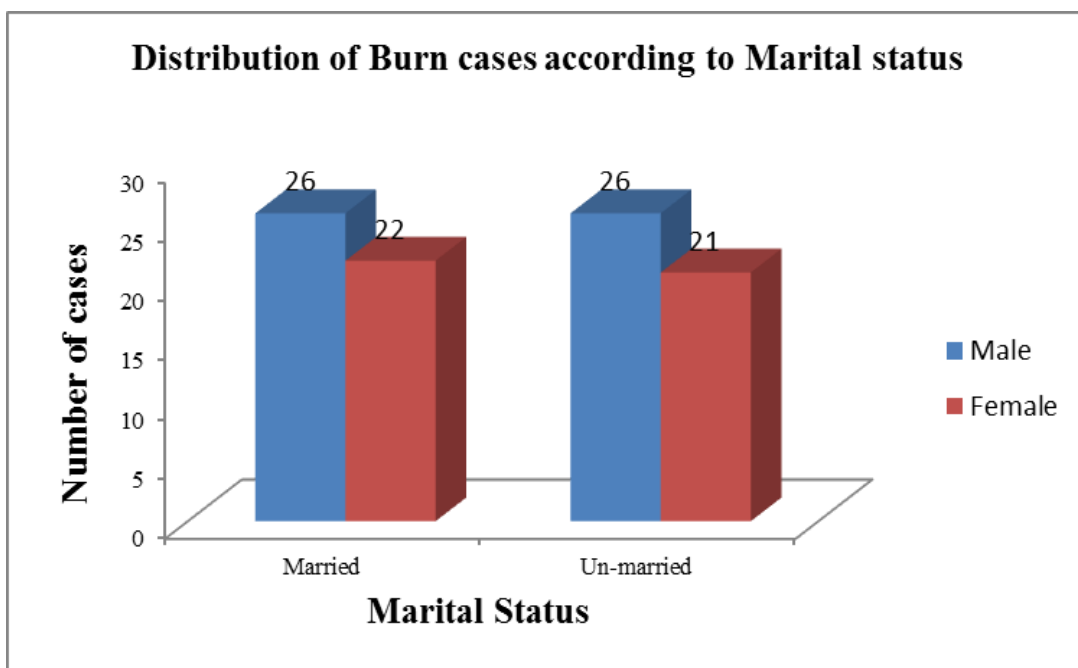

**Distribution of Burn cases according to marital status:**

Out of 95 burn cases, 48 (50.5%) were married and 47 (49.5%) unmarried. Of the 43 females, 22 (51.2%) were married and 21 (48.8%) unmarried in contrast to 52 males, 26 (50%) married and 26 (50%) unmarried.

**Table -26**

Marital Status	Male	Female	Total	
			Number	Percentage
<b>Married</b>	26	22	48	50.5
<b>Un-married</b>	26	21	47	49.5
<b>Total</b>	<b>52(54.7%)</b>	<b>43(45.3%)</b>	<b>95</b>	<b>100</b>

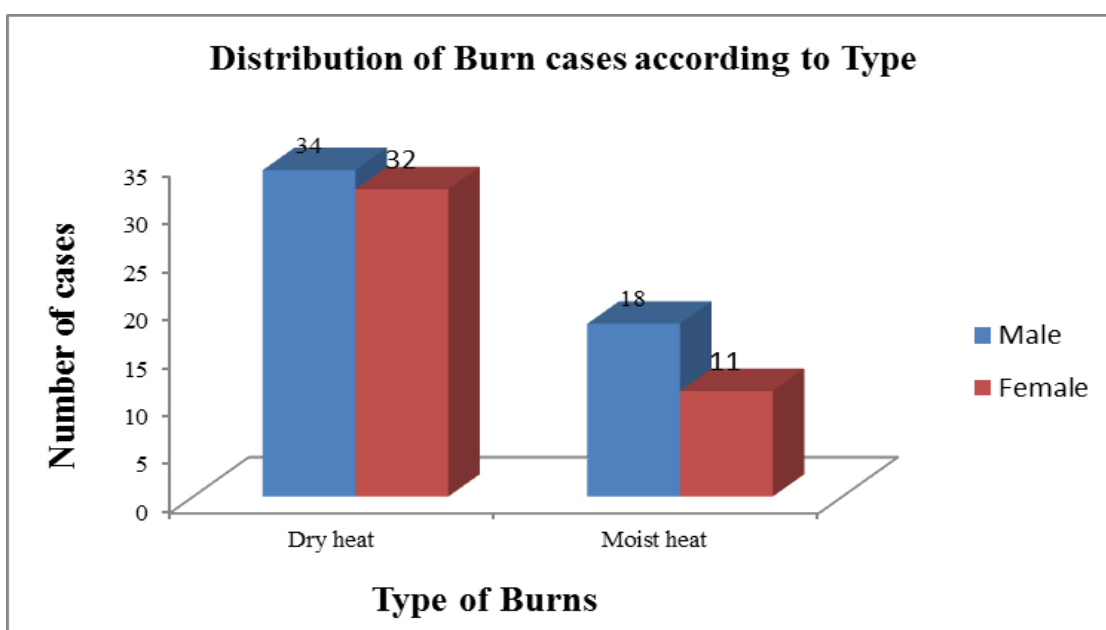

**Distribution of Burn cases according to Type:**

In this study, 66 (69.5%) cases of burns were due to dry heat and 29 (30.5%) cases were due to moist heat. Among 52 males, 34 (65.4%) were due to dry heat and 18 (34.6%) due to moist heat. Out of 43 females, 32 (74.4%) cases sustained burns due to dry heat and 11 (25.6%) due to moist heat.

**Table -27**

Type	Male	Female	Total	
			Number	Percentage
Dry heat	34	32	66	69.5
Moist heat	18	11	29	30.5
<b>Total</b>	<b>52 (54.7%)</b>	<b>43 (45.3%)</b>	<b>95</b>	<b>100</b>

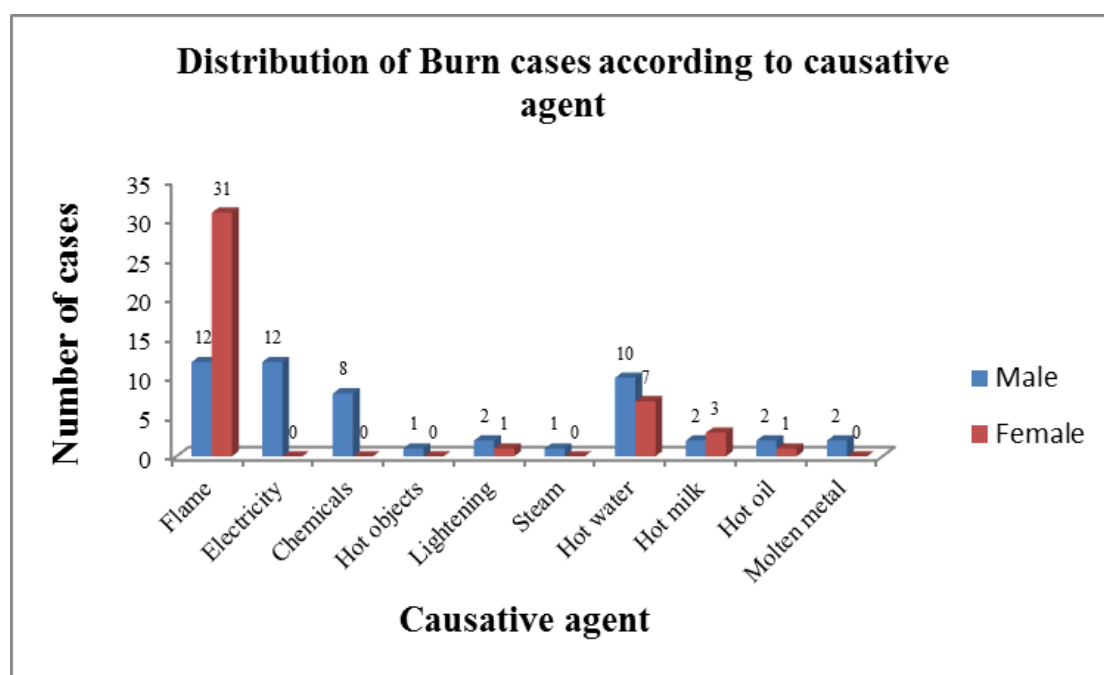

**Distribution of Burn cases according to causative agent:**

In this study, the most common cause of burns was flame 43 (45.2%) cases, followed by hot water 17 (17.9%) cases, electricity 12 (12.7%) cases, chemicals 08 (08.4%) cases, hot milk 05 (05.3%) cases and molten metal was responsible for minimum number of 02 (02.1%) cases.

**Table -28**

Causative agent	Male	Female	Total	
			Number	Percentage
Flame	12	31	43	45.2
Electricity	12	00	12	12.7
Chemicals	08	00	08	08.4

Molten metal	02	00	02	02.1
<b>Total</b>	<b>52 (54.7%)</b>	<b>43 (45.3%)</b>	<b>95</b>	<b>100</b>

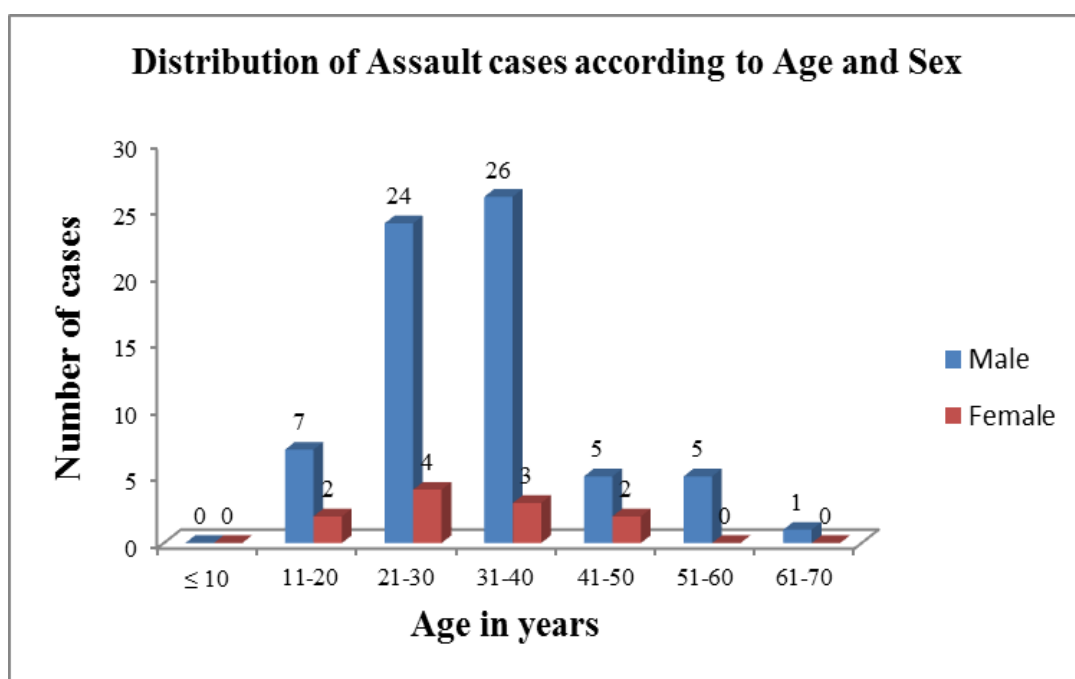

**Distribution of Assault cases according to Age and Sex:**

Out of 79 cases, 68 (86.1%) were males and 11 (13.9%) were females. Maximum number 29 (36.7%) were seen in the age group of 31-40 years, followed by 21-30 years of 28 (35.5%) cases. Minimum 01 (01.2%) victim was found in 61-70 years age group. There was not a single case in less than 10 years of age.

**Table -29**

Age	Male	Female	Total	
			Number	Percentage
≤ 10	00	00	00	00
11-20	07	02	09	11.4
21-30	24	04	28	35.5
31-40	26	03	29	36.7
41-50	05	02	07	08.9

61-70	01	00	01	01.2
<b>Total</b>	<b>68 (86.1%)</b>	<b>11 (13.9%)</b>	<b>79</b>	<b>100</b>

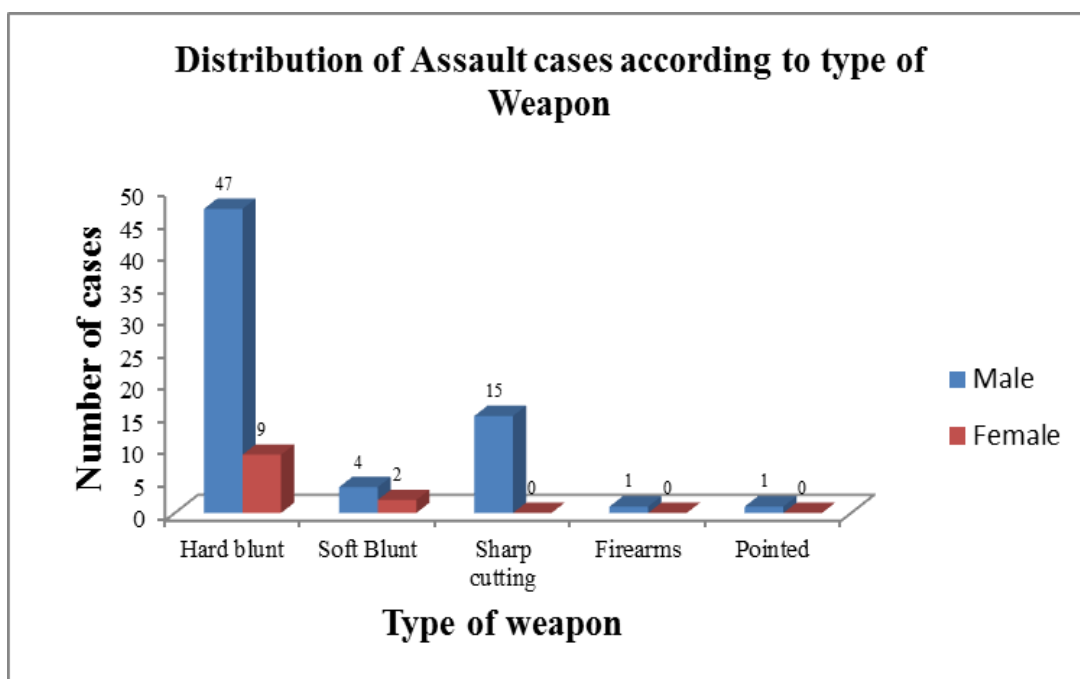

**Distribution of Assault cases according to type of Weapon:**

Out of total 79 cases, 56 (71.0%) cases were caused by hard blunt weapon, 15 (19.0%) cases by sharp cutting, 06 (07.6%) cases by soft blunt weapon, 01 (01.2%) case each were caused by use of pointed weapon and firearm.

**Table -30**

Type of Weapon	Male	Female	Total	
			Number	Percentage
<b>Hard blunt</b>	47	09	56	71.0
<b>Soft Blunt</b>	04	02	06	07.6
<b>Sharp cutting</b>	15	00	15	19.0
<b>Firearms</b>	01	00	01	01.2
<b>Pointed</b>	01	00	01	01.2
<b>Total</b>	<b>68 (86.1%)</b>	<b>11 (13.9%)</b>	<b>79</b>	<b>100</b>

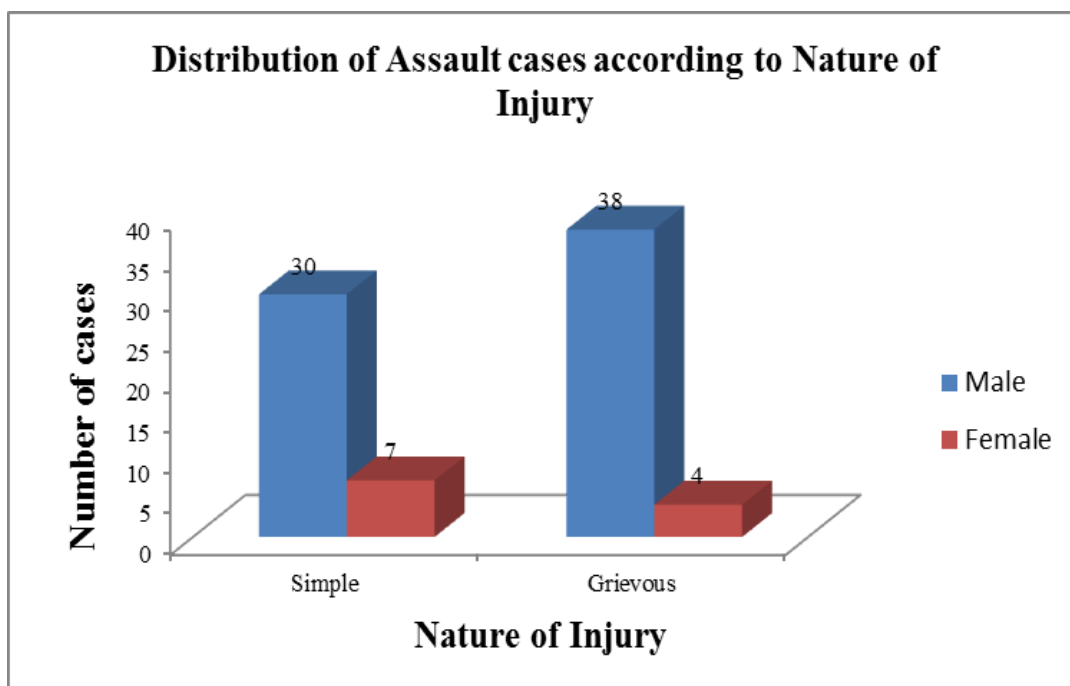

**Distribution of Assault cases according to Nature of Injury:**

Out of total 79 cases, 42 (53.1%) cases were categorized as grievous injury and 37 (46.9%) cases were categorized as simple.

**Table -31**

Nature of Injury	Male	Female	Total	
			Number	Percentage
Simple	30	07	37	46.9
Grievous	38	04	42	53.1
<b>Total</b>	<b>68 (86.1%)</b>	<b>11 (13.9%)</b>	<b>79</b>	<b>100</b>

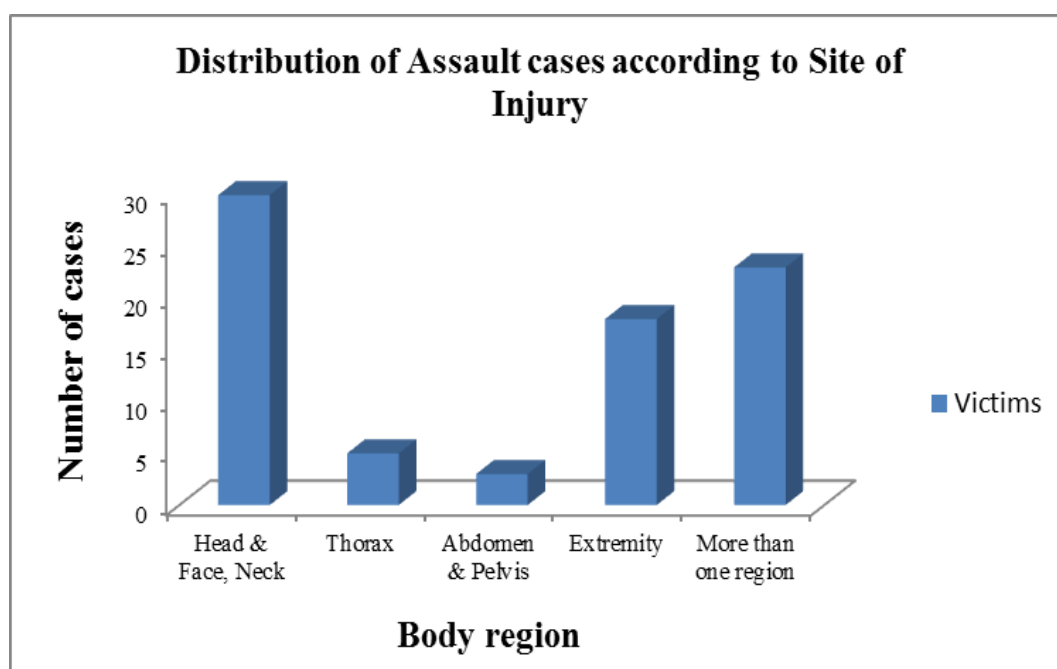

**Distribution of Assault cases according to body region involved:**

In the present study, the Head and face, neck was the most commonly injured region 30 (38.0%) cases, followed by involvement of more than one body region of 23 (29.1%) cases.

**Table -32**

Body Region	Total	
	Number	Percentage
Head and Face, Neck	30	38.0
Thorax	05	06.3
Abdomen & Pelvis	03	03.8
Extremity	18	22.8
More than one region	23	29.1
<b>Total</b>	<b>79</b>	<b>100</b>

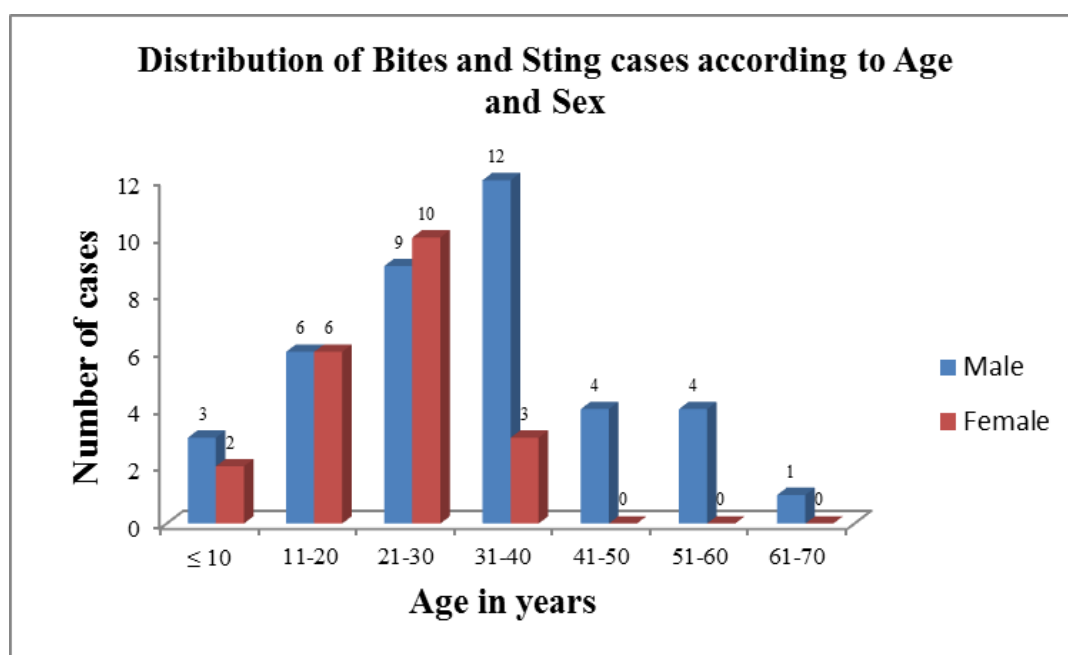

**Distribution of Bites and Sting cases according to Age and Sex:**

Out of 60 cases, 39 (65%) were males and 21 (35%) were females. Maximum number 19 (31.6%) cases were seen in the age group of 21-30 years, followed by 31-40 years of 15 (25%) cases. Minimum number of victim 01 (01.7%) case was found in 61-70 years age group.

**Table -33**

Age	Male	Female	Total	
			Number	Percentage
≤ 10	03	02	05	08.3

<b>Drowning</b>	02	00	02	09.5
<b>Total</b>	<b>14 (66.7%)</b>	<b>07 (33.3%)</b>	<b>21</b>	<b>100</b>

## **DISCUSSION**

### **Table 1:**

In the present study, RTA constituted the maximum of 1459 (68.8%) cases. Similarly in a study conducted at Government Wenlock District Hospital, Mangalore<sup>3</sup> for a period of one year to study the epidemiology of medico-legal cases, there were 161 (34.6%) RTA cases out of total 465 cases, which shows its predominance.

The predominance may be due to nature of our society where people lead a more active life and most of the times are involved in activities such as riding, driving and travelling.

### **Table 2:**

In the present study maximum number of victims 711 (33.5%) were in the age group of 21-30 years, followed by 530 (25%) cases in the age group of 31-40 years. The least numbers 56 (2.7%) cases were seen in the age of 60 years and above. The males 1596 cases (75.2 %) outnumbered the females with 524 cases (24.8%). Our result is consistent with the result of the study conducted at Government Wenlock District Hospital, Mangalore.<sup>3</sup>

This can be explained by the fact that at young age, people are more mobile, go out for work and take risks, while the elderly people usually stay at home. The male dominance may be due to the paternalistic nature of our society where males keep themselves most of the time outdoors to earn bread and butter for families besides male lead a more active life.

### **Table 3:**

Out of 2120 cases, the maximum cases 610 (28.8%) occurred between 4.01pm – 08 pm, followed by 513 (24.2%) cases between 6.01 am – 12 pm, which is contrary to

the study conducted at Government Wenlock District Hospital, Mangalore,<sup>3</sup> where maximum numbers 125 (26.8%) occurred between 6 am- 12 pm.

In case of RTA, out of 1459 cases, maximum numbers 458 (31.4%) accidents occurred between 4.01pm – 08 pm. Our results are similar with the results of the studies conducted at GTB Hospital, Delhi,<sup>6</sup> Municipal Corporation, Delhi,<sup>8</sup> Government Wenlock District Hospital, Mangalore<sup>10</sup> and MTH, Nepal.<sup>13</sup> However, our result is not consistent with the studies conducted at SMS Medical College, Jaipur<sup>11</sup> and Indira Gandhi Medical College, Nagpur,<sup>15</sup> where maximum number of accidents occurred during morning hours between 9am-12pm.

The maximum number of accidents in the evening may be due to high rush hour traffic (people return home from work), tiredness after a day work, urgency to reach home, poor visibility due to insufficient road lighting, evening is the time to go to and return from entertainment etc.

In case of poisoning, out of 167 cases, maximum numbers 45 (27%) cases occurred between 8.01 pm-06.00 am. Our result is not consistent with the studies conducted at Government Wenlock District Hospital, Mangalore<sup>3</sup> and M.K.C.G. Medical college hospital, Behrampur, Orissa,<sup>25</sup> where maximum number of poisoning occurred during day time.

This can be explained by the fact that most of the people are engaged in multifarious works and are subjected to great stress and strain, which makes them vulnerable to attempt self poisoning at the end of the day.

In case of burns, out of 95 cases, maximum numbers 46 (48.4%) cases occurred between 06.01 am-12.00 pm. Our result is consistent with the result of study conducted at B.J. Medical College, Ahamedabad.<sup>35</sup>

This can be explained by the fact that most cooking related activities are undertaken in the morning hours.

**Table 4:**

In the present study, domicile pattern of the victims showed 1219 (57.5%) cases were from urban areas and 901 (42.5%) cases from rural areas.

In case of RTA, maximum cases 934 (64%) were from urban areas and 525 (36%) from rural areas. Our result is similar with the result of the study conducted at Indira Gandhi Medical College, Nagpur<sup>15</sup> and in contrast to the result of the study conducted at MTH, Nepal,<sup>13</sup> where victims from rural areas 237 (65.83%) were more as compared to urban areas 123 (34.17%).

This could be due to the larger section of population concentrated in urban areas due to modernization and industrialization, busy life opted by urban people and multiple workers in household increases the chances of vehicle ownership.

Among Poisoning cases, maximum cases 112 (67%) were from rural areas and 55 (33%) from urban areas. This is similar to the results of the studies conducted at MKCG Medical College, Orissa<sup>25</sup> and Al-Ameem Medical College, Bijapur.<sup>29</sup>

This is possibly due to illiteracy and poverty of agricultural farmers and solely depends on the agricultural income for their living. Due to some reason (i.e. either lack of water or flood) if they are not able to generate the required income for their day to day living and commitments, they may get frustrated and resort to suicide by these agro-chemicals, which are available in their backyard.

In case of Burns, out of 95 cases, maximum numbers 53 (55.8%) cases were from rural areas and 42 (44.2%) from urban areas. Our results are similar with the result of the study conducted at MY Hospital, Indore.<sup>38</sup>

This could be due to the traditional household practice, lack of safety system and the prevailing socio-cultural determinant.

**Table 5:**

In the present study, the overall mortality rate was 9%. This less mortality rate could be due to the study which was conducted at a tertiary referral center with more experienced doctors, well trained staffs and sophisticated equipments.

**Table 6:**

In the present study, majority of RTA victims 1164 (79.8%) were males. Most commonly involved age group was 21-30 years with 513 (35.2%) cases, followed by 31-40 years with 362 (24.8%) cases. People in extreme of age comprised the minimum number of 12 (0.8%) cases. Our results are similar to the results of studies conducted at Government Wenlock District Hospital, Mangalore,<sup>3</sup> GTB Hospital, Delhi,<sup>6</sup> SDH and BPKIHS Hospital, Nepal,<sup>7</sup> Municipal Corporation, Delhi,<sup>8</sup> JIPMER Hospital, Pondicherry,<sup>9</sup> Government Wenlock District Hospital, Mangalore<sup>10</sup> and MGIMS, Maharashtra.<sup>12</sup>

The male preponderance may be due to the paternalistic nature of our society where males keep themselves most of the time outdoors to earn bread and butter for families besides male lead a more active life and most of the time are involved in activities such as driving and travelling. On the contrary, females generally keep themselves indoor due to cultural background or lack of industries or low potential for employment owing to poor literacy. And also, it is the tendency that some male members mostly accompany females and extra precautions are taken on roads. In total, more than half (74%) of the victims were in the age between 21-50 years. This may be due to the fact that persons of this age group lead more active life and they

have a universal habit of taking risks like boarding a moving vehicle, travelling on footboard of vehicle, crossing road carelessly, risky speed driving, etc.

Least cases in older people may be due to experience, more traffic sense, less tendency to take undue risks and they remain mostly indoors and lead less active life. The lesser involvement of children below 10 years may be because of some senior member of the family accompanies them on road.

**Table 7:**

In the present study, the maximum 374 (25.6%) RTA victims had education up to 5<sup>th</sup> class, 312 (21.4%) victims had education up to 8<sup>th</sup> class and 270 (18.5%) victims had education up to 10<sup>th</sup> class. Victims with higher education (intermediate and above) were fewer in number of 223 (15.3%) cases and illiterates were 265 (18.2%). It was observed that more people with lower levels of education were involved more in road traffic accidents and our results are similar to the results of studies conducted at SDH and BPKIHS Hospital, Nepal,<sup>7</sup> Municipal corporation, Delhi,<sup>8</sup> JIPMER Hospital, Pondicherry.<sup>9</sup> However, this relationship between education and road traffic accidents may not be casual.

**Table 8:**

Among the victims of RTA, the labourers 533 (36.6%) were highest in number among victims, employee in service 280 (19.2%), agriculturist 264 (18.1%) and students 257 (17.6%) cases. Our results are similar to the results of studies conducted at SDH and BPKIHS Hospital, Nepal<sup>7</sup> and JIPMER Hospital, Pondicherry.<sup>9</sup> In a study conducted at Municipal Corporation, Delhi,<sup>8</sup> the maximum numbers of victims were the business group people.

The reason may be that the laborers travel in all types of motorized vehicles as a part of their work carrying bricks, heavy materials and others.

**Table 9:**

In the present study, the occupants of motor cycle 872 (59.8%) cases were the highest number of victims involved in RTA followed by occupants of Light motor vehicle 236 (16.2%) cases and pedestrian accounted for 183 (12.5%) cases. Our results are similar to the results of studies conducted at Municipal Corporation, Delhi,<sup>8</sup> Krishna Hospital and MRC, Maharashtra<sup>14</sup> and Indira Gandhi Medical College, Nagpur,<sup>15</sup> in which the occupants of two wheelers were commonly involved in accidents. The reason could be due to higher speed, which can be achieved over short distance and less stability of vehicle.

However, our result is not consistent with the results of the study conducted at GTB Hospital, Delhi,<sup>6</sup> JIPMER Hospital, Pondicherry,<sup>9</sup> Government Wenlock District Hospital, Mangalore,<sup>10</sup> and MGIMS, Maharashtra<sup>12</sup> where maximum numbers of victims were pedestrians. In the study conducted at SDH and BPKIHS Hospital, Nepal,<sup>7</sup> the occupants of the bicyclist were commonly involved.

**Table 10:**

In the present study, maximum number of 497 (34.1%) RTA cases occurred during summer season, followed by 492 (33.7%) cases in rainy season and least number 470 (32.2%) in winter. There was no significant seasonal variation in the occurrence of road traffic accidents in our study. Our results are similar to the results of studies conducted at GTB Hospital, Delhi.<sup>6</sup> This may be due to the different environmental conditions in different seasons, which act as one of the important contributors to the occurrence of accidents. During summer season the hot environment makes the person tired, irritable and rash; during rainy season the factors like worsening of road and poor visibility to drivers due to rain and during winter months, the longer hours of

darkness, poor visibility to drivers at night and early hours of the day due to foggy weather conditions may lead to increase in the occurrence of accidents.

The studies conducted at SDH and BPKIHS Hospital, Nepal,<sup>7</sup> Municipal Corporation, Delhi,<sup>8</sup> JIPMER Hospital, Pondicherry,<sup>9</sup> Government Wenlock District Hospital, Mangalore<sup>10</sup> and MTH, Nepal,<sup>13</sup> where maximum numbers of accidents were seen in rainy months.

**Table 11:**

In the victims of RTA, the involvement of more than one region of the body was present in maximum number of victims 632 (43.3%), followed by the involvement of Head and face, neck seen in 525 (36.0%) victims. However, the result of the study conducted at GTB Hospital, Delhi<sup>6</sup> showed head and neck was the most commonly involved region, study conducted at Government Wenlock District Hospital, Mangalore<sup>10</sup> showed abdomen region was common and study conducted at Indira Gandhi Medical College, Nagpur<sup>15</sup> revealed injury to lower extremities was the most common region involved.

**Table 12:**

Out of 110 fatal cases of RTA, the commonest cause of death was head injury comprising 65 (59.1%) cases, followed by hemorrhagic shock 26 (23.6%), spinal cord injury 11 (10%) and septicemia 08 (07.3%) cases. Our results are similar to the results of studies conducted at SMS Medical College, Jaipur<sup>11</sup> and MGIMS, Maharashtra,<sup>12</sup> while a study conducted at GTB Hospital, Delhi<sup>6</sup> showed hemorrhagic shock as the most common cause of death.

**Table 13, Table 14, table 15, Table 16:**

Falls from height is one of the common causes of morbidity and mortality in all age groups.

In the present study, majority of victims 142 (75.5%) were males and this is consistent with the result of the studies by Al B et al.<sup>20</sup> and Osifo OD et al.<sup>21</sup> The maximum numbers of victims 47 (25.0%) cases were seen in the age group of 21-30 years. The reason could be at this age people are more active and go out for the work; hence, they are more prone for accidental fall. However, in the similar study conducted by Al B et al.,<sup>20</sup> 83.5% victims were below 20 years.

In the present study, majority of the falls occurred during the summer season, followed by rainy season. The maximum 22 (11.7%) cases occurred during the month of April, followed by 19 (10.1%) cases in the month of August. Children have contributed significantly to the number of cases of fall in the summer. This could be attributed to the fact that children are more involved in playing during these months of school vacation. Higher number of cases in the rainy season could be due to the slippery outdoors. In the study done by Osifo OD et al.,<sup>21</sup> peak incidences of falls were between March and May.

In the present study, majority of the fall 49 (26.1%) cases were from staircase. However, in the study by Osifo OD et al.,<sup>21</sup> falls from moving vehicles, top of the buildings and treetops were common. In the present study, the Head & face, neck was the most commonly injured region in 76 (41.0%) cases. This could be due to the reason that our hospital is a tertiary level referral hospital and cases of head injury are referred from neighboring districts of Karnataka, Goa and Maharashtra. Conversely, in the study by Hahn MP et al. the most common injuries were fractures of the thoracic and lumbar spine (83%) with a preference for the thoraco lumbar junction.<sup>18</sup> Cranio-cerebral injury was the most common injury in fatal falls in this study and similar was the result of the study by Venkatesh VT<sup>19</sup> and Al B et al.<sup>20</sup>

**Table 17:**

In the present study, majority of poisoning victims 85 (50.9%) were males. Maximum numbers of victims 50 (30.0%) cases were seen in the age group of 21-30 years and minimum number of victims 12 (07.2%) were found in 10 years age group. Our results are similar to the results of studies conducted at MKCG Medical College, Orissa, <sup>25</sup> Government Wenlock Hospital, Mangalore, <sup>26</sup> Civil Hospital, Belgaum, <sup>27</sup> Al-Ameem medical College, Bijapur <sup>29</sup> and St. Martha Hospitals, Bangalore. <sup>30</sup> The studies conducted at southern district, Sri Lanka <sup>23</sup> and S.K. Hospital, Haryana <sup>24</sup> revealed male dominance and common age group involved was 15-25 years.

The present study along with many other studies, gives the picture that it's the youth between the ages of 20-29 years who are more prone for poisoning. In most of these youths, it is suicidal intent rather than accidental which is killing factor, which is a big loss to any society or nation. Reasons seem to be many, mental instability and inability to face adverse eventualities in life like unemployment in spite of being graduates, love failures, repeated failures in exams, failure of crops, family disputes and so on.

It is evident from the present study and other studies, that the males are more prone for poisoning. Females are well guarded from adversities for life, starting from childhood up to old age, as daughter by parents, as wife by husband and as mother by son. The Indian society, traditionally and culturally, is sympathetic to women which boosts their mortality and self confidence in life. Man being the bread earner of the family in most cases, all transactions go in his name. If failed to fulfill the basic requirements for the family, due to frustrations they end their lives.

**Table 18:**

Among the victims of poisoning, maximum number 71 (42.6%) belonged to Class V status, followed by Class IV with 51 (30.6%) cases and least numbers 02 (01.2%) cases in Class I. Our results are similar to the results of studies conducted at Shri M.P.Shah Medical College, Gujarat,<sup>28</sup> Al-Ameem medical College, Bijapur<sup>29</sup> and Dr. Susheela Tewari Memorial Trust Hospital, Uttarkand.<sup>31</sup> The studies conducted at MKCG Medical College, Orissa<sup>25</sup> revealed that more victims are of medium socioeconomic class.

The victims of low and medium socioeconomic class are more vulnerable for poisoning (suicide) as they are under continuous financial and other stress during life.

**Table 19:**

In the present study, the agriculturist 72 (43.1%) were the highest in number among the poisoning victims and the laborers were the next largest group with 39 (23.3%) victims. Our results are similar to the results of studies conducted at S.K. Hospital, Haryana,<sup>24</sup> Civil Hospital, Belgaum,<sup>27</sup> Shri M.P.Shah Medical College, Gujarat<sup>28</sup> and Al-Ameem medical College, Bijapur.<sup>29</sup> However, our result is not consistent with the study conducted at St. Martha Hospitals, Bangalore,<sup>30</sup> where maximum numbers of victims were laborers.

It is evident from the present and other studies, that agriculturist are more prone for suicidal poisoning. The reasons as gathered orally, from victims and relatives seem to be manifold, like, repeated crop failure, unable to return the loans taken for the sake of agriculture, ever increasing debt and interest of loans, lack of even basic needs for survival back home, no knowledge of other jobs etc. Thus frustrated and dejected, they end their lives.

**Table 20:**

In the present study, the commonest manner of poisoning was suicidal in 140 (83.8%) cases, followed by accidental 25 (15.0%) and homicidal 02 (01.2%) cases. Our results are similar to the results of studies conducted at southern district, Sri Lanka,<sup>23</sup> S.K. Hospital, Haryana,<sup>24</sup> Government Wenlock Hospital, Mangalore,<sup>26</sup> Civil Hospital, Belgaum,<sup>27</sup> Shri M.P.Shah Medical College, Gujarat<sup>28</sup> and Al-Ameem Medical College, Bijapur.<sup>29</sup>

It is evident from the present study as well as from other studies quoted, that in most of the poisoning cases, suicide is the main intention, in both developing and developed countries. Agrochemicals are the most commonly used agents in developing countries like India, Sri-Lanka and Bangladesh. This can be attributed to the fact that, even for trivial problems, people have found suicide as best solution by agrochemicals which are easily available and which could be easily consumed.

**Table 21:**

In the present study, maximum number of poisoning cases 58 (34.8%) occurred during summer season, followed by 57 (34.1%) cases in rainy season and least numbers 52 (31.1%) in winter. Our results are similar to the results of studies conducted at MKCG Medical College, Orissa.<sup>25</sup>

This seasonal variation with summer season dominance can be attributed to agriculture and rain. In summer, there is scarcity of water for agriculture. In India rain is the main source of water for agriculture and failure of adequate rains has become a common phenomenon in most parts of the country with some exceptions. This drought situation is highly unsuited for cultivation. Thus, those families which are totally dependent on agriculture and rains for agriculture face the worst threat for

basic needs. Finally, instead of starving to death, they cling on to this method of suicide. Obviously such people use agrochemicals present at home.

**Table 22:**

In the present study, maximum numbers of cases were due to poisoning by agrochemicals 112 (67.0%). This result is similar to the results of the studies conducted at southern district, Sri Lanka, <sup>23</sup> Government Wenlock Hospital, Mangalore <sup>26</sup> and Shri M.P.Shah Medical College, Gujrat. <sup>28</sup>

But this result of agrochemical dominancy is in contrast with the result of the study conducted at S.K. Hospital, Haryana, <sup>24</sup> where the most common type of poisoning was Aluminum phosphide.

Among 112 cases of agrochemicals, in the present study, maximum numbers were due to poisoning by Organophosphorus compounds with 75 (67%) cases. This result is similar to the studies conducted at MKCG Medical College, Orrisa, <sup>25</sup> Civil Hospital, Belgaum, <sup>27</sup> Al-Ameem medical College, Bijapur, <sup>29</sup> St. Martha Hospitals, Bangalore <sup>30</sup> and Dr. Susheela Tewari Memorial Trust Hospital, Uttarkand. <sup>31</sup>

Agrochemicals in general and Organophosphorus in particular are the agents commonly used, as seen in the present study. This can be attributed to a number of factors like easy availability as they are sold in open market without strict vigil and also much cheaper. The occupation of most victims being agriculture, these chemicals are almost always present in home and readily procurable. These can be easily consumed orally. Another thing that was noticed, upon inquiring the hospital victims, was they were sure of mortality due to these compounds as they seen many die the same way in their vicinity. Thus people are more knowledgeable about agrochemicals than any other poison.

**Table 23:**

In the present study, majority of burn victims 52 (54.7%) were males. This result is similar to the results of the studies conducted at Hacettepe University, Turkey,<sup>33</sup> SMS Hospital, Jaipur,<sup>34</sup> Alexandria Main University Hospital, Egypt<sup>36</sup> and MY Hospital, Indore.<sup>38</sup>

However, our result is not consistent with the results of the study conducted at Government Wenlock District Hospital, Mangalore,<sup>3</sup> BJ Medical College, Ahmedabad,<sup>35</sup> JN Medical College and Hospital, UP,<sup>37</sup> Jawaharlal Nehru Medical College and Hospital, Aligarh<sup>39</sup> and Government Teaching hospital, South India,<sup>40</sup> where maximum numbers of victims were females.

This could be attributed to the male dominant society and female's close proximity to fire throughout the day and night.

Maximum number 31 (32.6%) cases were seen in the age group of 21-30 years, followed by 31-40 years of 28 (29.5%) cases. It was found that 62.1% victims were between 21-40 years. Our results are similar to the result of study conducted at MY Hospital, Indore.<sup>38</sup>

This is the productive age, when they are generally active and exposed to hazardous situations both at home and work. Proper care and rehabilitation of these patients is critical as they belong to productive age group (they are the earning members of the family).

**Table 24:**

In the present study, 63 (66.3%) cases had 25 % TBSA burns, 21 (22.1%) cases had 26-50% burns, 07 (07.4%) had 51-75 % burns and 04 (04.2%) had burns more than 75%. This result is similar to the results of the studies conducted at Jawaharlal Nehru Medical College and Hospital, Aligarh.<sup>39</sup>

However, our result is not consistent with the results of the study conducted at Government Wenlock District Hospital, Mangalore,<sup>3</sup> BJ Medical College, Ahmedabad<sup>35</sup> and Government Teaching hospital, South India<sup>40</sup>, where the involvement of total body surface area was in between 25-50%.

**Table 25:**

In the present study, maximum 81 (85.2%) victims had superficial burns and 14 (14.8%) had deep burns and our result is similar to the study conducted at Government Wenlock District Hospital, Mangalore.<sup>3</sup>

**Table 26:**

Among the victims of burns, 48 (50.5%) were married and 47 (49.5%) unmarried. Among 43 females, 22 (51.2%) were married and 21 (48.8%) unmarried and in contrast to 52 males, 26 (50%) married and 26 (50%) were unmarried. Our results are consistent with the studies conducted at JN Medical College and Hospital, UP<sup>37</sup> and Jawaharlal Nehru Medical College and Hospital, Aligarh.<sup>39</sup>

This could be due to increasing familial stress due to day to day problem like jobs, cooking, Children, etc. and hurrying through in an overcrowded room with minimal amenities inviting frequent accidents.

**Table 27 and Table 28:**

In the present study, 66 (69.5%) cases of burns were due to dry heat and 29 (30.5%) cases were due to moist heat. Out of 95 cases, the most common cause of burns was flame 43 (45.2%) cases and followed by hot water 17 (17.9%) cases in respect to moist heat. Our results are similar with the studies conducted at Hacettepe University, Turkey,<sup>33</sup> SMS Hospital, Jaipur,<sup>34</sup> BJ Medical College, Ahmedabad,<sup>35</sup> Alexandria Main University hospital, Egypt,<sup>36</sup> JN Medical College and Hospital, UP,<sup>37</sup> MY Hospital, Indore<sup>38</sup> and Government Teaching hospital, South India.<sup>40</sup>

This could be due to the wide use of kerosene oil stoves in this part, especially by the population belonging to low socioeconomic status. The use of substandard kerosene oil exposes the users to higher risks of accident.

In our study, hot water 17 (17.9%) cases was the most common cause in respect to moist heat. This could be due to the more proximity of females to hot water during their work (cooking) at home.

**Table 29:**

In the present study of 79 assault cases, 68 (86.1%) were males and 11 (13.9%) were females. Maximum number 29 (36.7%) were seen in the age group of 31-40 years, followed by 21-30 years of 28 (35.5%) cases. Our results are similar to the results of the study conducted at Government Wenlock District Hospital, Mangalore.<sup>3</sup>

The male predominance may be explained by the fact that male by nature indulge in more violent activities as compared to the females. The age group below 40 years is more active, violent, arrogant and more vulnerable to the fast changing social trends and culture as they mentally a bit immature with little experience of life.

**Table 30:**

In the present study, majority of 56 (71.0%) assault cases were caused by hard blunt weapon. The popularity of blunt weapons may be due to their easy availability and handiness in use and moreover, they give very little apprehension and frightening or warning to run or escape to run to the victim. This result is similar to study conducted at Government Wenlock District Hospital, Mangalore.<sup>3</sup>

**Table 31 and Table 32:**

Among the assault cases, 42 (53.1%) cases were categorized as grievous and 37 (46.9%) cases were categorized as simple injury. The Head and face, neck was the most commonly injured region in 30 (38.0%) cases. Our results are similar to the

results of the study conducted at Government Wenlock District Hospital, Mangalore.<sup>3</sup> The reason could be explained as the head is the target of choice in great majority of assaults involving blunt trauma when the intention is to kill.

**Table 33, Table 34 and Table 35:**

In the present study of bites and stings, 39 (65%) were males and 21 (35%) were females and maximum numbers 19 (31.6%) cases were seen in the age group of 21-30 years and this is consistent with the result of the study conducted at Khuzestan Health Centre, Iran.<sup>48</sup> People of this age group are more prone as they are more active and go out for the work (in fields).

In this study, Snake bites 32 (53.3%) were the most common. However, in the study conducted at Community Health Centre of Himachal Pradesh,<sup>49</sup> wasp and bee bites were common followed by snake bite. The lower limb 35 (58.2%) cases were the most common body part affected and this is consistent with the result of study conducted at Khuzestan Health Centre, Iran.<sup>48</sup>

In this part of the study, the area being Malnad and agriculture is the main occupation, the laborers and farmers are commonly exposed to the common species, being snake.

**Table 36 and Table 37**

In the present study of mechanical asphyxial cases, 14 (66.7%) were males and 07 (33.3%) were females. The maximum numbers 09 (42.9%) cases were seen in the age group of 21-30 years followed by 31-40 years 06 (28.5%) cases. Our results are similar to the results of the study conducted at Kasturba Medical College, Manipal, India<sup>50</sup> and at All India Institute of Medical Sciences.<sup>51</sup> The age group of 21-30 years is the most active phase of life, physically and socially, and hence outnumbers the other age group.

In this study, hanging 11 (52.4%) cases was the most common type of asphyxia and was common in males in the age group of 21-30 years. This is similar to the study conducted at Kasturba Medical College, Manipal, India.<sup>50</sup> This can be explained by the fact that in our Indian system, males are the bread earners in large proportion of families and if unable to meet the demands of the family, they are more prone to commit suicide.

## **CONCLUSION**

The present study helps to interpret the types of medico-legal cases presenting at the casualty of the KLES'S DR. Prabhakar Kore Hospital and MRC, Belgaum. The medico-legal cases are on the rise and this is due to increased vehicular traffic density, un-employment, high income disparities, substance abuse, meager infrastructure facilities, insurance/compensations etc.

The medico-legal cases cost a lot not only to the individuals affected and their families but also to the nation. The disability and fatality resulting from these put a significant drain on the economy of the nation.

In the present study, RTA constituted the maximum of 68.8%, fall from height 8.9%, poisoning 7.9%, burns 4.5%, assault 3.7%, bites and stings 2.8 and mechanical asphyxia 1% of total medico-legal cases. The maximum numbers of victims 33.5% were in the age group of 21-30 years and 75.2 % of victims were males. More than 50% of incidents occurred in urban areas and the mortality rate was 9%.

The various preventive measures can be employed to minimize the medico-legal cases. Road traffic accidents contribute major share of all medico-legal cases and if occurrence of vehicular accidents are prevented, by strict implementation of traffic rules, improvements of roads, educating people and creating awareness in the community about the road safety measures, most of the cases can be reduced. The cases of burns may be prevented by creating awareness among public about safety measures, first aid education and timely treatment. In this study, most of the poisoning cases are involving farmers, who usually take the extreme step to end their lives because of poverty, ignorance and loss in agriculture. Farmers are the back-bone of our country and they should get helping hand from the Government during their

financial crisis. The fall from height cases can be reduced by employing safety measures at work place. The assault cases can be reduced by implementing stringent laws against the offenders, creating public awareness against homicides and motivating the public at the community level regarding the emotional control factor. The bites and stings are quite common in rural areas, which can be controlled by removing garbage's, controlling stray dog population and sensitizing the medical and para-medical workers to maintain adequate medications at primary health centre level. The community should be made aware of the consequences and complications following bites and stings and first aid measures. The suicidal hanging cases can be reduced by identifying the susceptible population who are psychologically stressed and extending the psychiatric services to the community to help these high risk individuals.

The incidence of medico-legal cases must be reduced as it is involving the most productive age group leading to substantial socio-economic impact on the society, by creating awareness among youths through educational programmes.

This study will provide an insight to the policy makers, law custodians and the community to look into the specific aspects of the cases and to take measures accordingly for the benefit of the community and people at large.

## **SUMMARY**

In the present cross-sectional study conducted at KLES'S DR. Prabhakar Kore Hospital and MRC, Belgaum during 1 year period from 1<sup>st</sup> January 2009 to 31<sup>st</sup> December 2009, a total of 2120 cases registered at the medico-legal register were studied. The purpose of the study was to know the pattern of medico-legal cases with respect to type, age, sex, marital status, domicile, occupation, educational status, socio-economic status, time and place of incident, manner of incident and cause of death. The predesigned and pretested proforma was used to collect the required data and following were the findings:

1. **Out of 2120 medico-legal cases**, RTA constituted the maximum of 1459 (68.8%) cases.
2. The largest number of victims 711 (33.5%) were in the age group of 21-30 years.
3. The maximum number of cases 610 (28.8%) occurred during the evening hours between 4.01pm – 8 pm.
4. The majority 1219 (57.5%) victims were from urban areas.
5. The mortality rate was 09%.
6. **Out of 1459 RTA cases**, the maximum number of victims were males with 1164 (79.8%) and the majority of victims 513 (35.2%) were in the age group of 21-30 years.
7. The maximum 374 (25.6%) RTA victims had education up to 5<sup>th</sup> class.
8. The labourers 533 (36.6%) were highest in number among RTA victims.
9. The occupants of motor cycle 872 (59.8%) cases were the highest number of victims involved in RTA and Pedestrian accounted for 183 (12.5%) cases.
10. The maximum number 497 (34.1%) RTA cases occurred during summer season.

11. The commonest cause of death in RTA's was head injury comprising 65 (59.1%) cases.
12. **Out of 188 Fall from height cases**, the majority of victims were males with 142 (75.5%) and maximum number of victims 47 (25.0%) were seen in the age group of 21-30 years.
13. Maximum number of victims 22 (11.7%) had sustained fall in the month of April.
14. Majority of the fall 49 (26.1%) cases were from staircase and Head & face, neck was the most commonly injured region in 76 (41.0%) cases.
15. **Out of 167 poisoning cases**, the majority 85 (50.9%) victims were males and maximum numbers of 50 (30.0%) victims were in the age group of 21-30 years.
16. The commonest manner of poisoning was suicidal with 140 (83.8%) cases and maximum number 71 (42.6%) cases belonged to Class V socio-economic status.
17. Maximum number 58 (34.8%) poisoning cases occurred during summer season.
18. The agriculturist 72 (43.1%) were the highest in number among the victims and agrochemicals 112 (67.0%) was the most common type of poison.
19. **Out of 95 Burns cases**, the majority 52 (54.7%) victims were males and the largest number 31 (32.6%) cases were seen in the age group of 21-30 years.
20. The majority, 63 (66.3%) victims had less than 25 % TBSA burns.
21. The majority of victims 81 (85.2%) had superficial burns.
22. The maximum, 66 (69.5%) cases of burns were due to dry heat and the most common cause of burns was flame with 43 (45.2%) cases.
23. **Out of 79 Assault cases**, the majority 68 (86.1%) victims were males and maximum number 29 (36.7%) were seen in the age group of 31-40 years.
24. The majority 56 (71.0%) cases were caused by hard blunt weapon and head and face, neck were the most commonly injured region in 30 (38.0%) cases.

25. The Grievous injury was seen in a majority group, 42 (53.1%) cases.
26. **Out of 60 Bites and sting cases**, the majority 39 (65%) were males and maximum number 19 (31.6%) cases were seen in the age group of 21-30 years.
27. The most common animal species involved in bites were snakes, 32 (53.3%) and the most common body part affected was the lower limb, 35 (58.2%).
28. **Out of 21 Mechanical Asphyxia cases**, the majority 14 (66.7%) victims were males and the maximum number 09 (42.9%) cases were seen in the age group of 21-30 years.
29. The hanging 11 (52.4%) cases was the most common type.

**CONSENT FORM**

**INFORMED CONSENT:**

[For patients /patient's attendants/ parents or guardians in case of children < 12 years]

This study is undertaken to analyze the pattern of medico-legal cases at KLES'S DR.PRABHAKAR KORE HOSPITAL AND MRC, Belgaum during the period 1<sup>st</sup> January 2009 to 31<sup>st</sup> December 2009. You are asked to read this form and permitted to ask any questions before agreeing to give consent for collecting the required data.

Information regarding bio-data & circumstances of the incident will be collected from you, by asking questions as entered in the questionnaire. This interview may cause psychological discomfort to you. If required, photographs will be used ensuring that the identity of the patient won't be revealed.

As such there is no direct benefit on the part of the present condition but you will be providing information for the welfare of the society.

All the information collected during this study will be kept confidential to the extent permitted by law. Information, which identifies the patient, will not be released unless required by the court. Information from this study may be published, but the identity of the patient will not be revealed.

The patients or attendants will not be paid or offered any gifts during the study and your decision whether or not to participate will not affect the usual procedure. If you decide to participate, you are free to withdraw at any time.

During the study period if the case proved to be a case other than intended in the study the patient participation in this study will be withdrawn without any consent.

---

**Consent to participate in the study:**

I give consent to carry out the study on me/ patient by **BF0108001** by signing on the line below. I have gone through the questionnaire in detail/read to me/made me understand in my own language.

**\*Signature of the participant or legally authorized representative.**

Name of the patient: \_\_\_\_\_

Signature of the patient/ or legally authorized person: \_\_\_\_\_

Witness: **BF0108001**

Witness sign: \_\_\_\_\_

Date: \_\_\_\_\_

---

**PROFORMA**

**PATTERN OF MEDICO-LEGAL CASES AT KLES'S DR.PRABHAKAR  
KORE HOSPITAL AND MRC, BELGAUM.**

[Information obtained from: patient/ patient's attendant/ parents or guardians in case of children < 12 years.]

**I. GENERAL PARTICULARS:**

**S1. NO:**

**IP/OP.NO:**

- 1. Name:**
  - 2. Age:** \_\_\_\_\_years.
  - 3. Sex:** Male/Female
  - 4. Marital status:** Married/Unmarried
  - 5. Address:**
  - 6. Occupation:** laborer/ service/ agriculturist/ student/ house wife/ retired/  
un-employed / not applicable.
  - 7. Socio-economic status:** Class 1/ Class 2/ class 3/ Class 4/ Class 5.
  - 8. Educational status:** Illiterate/Education up to 5<sup>th</sup> class/Education up to  
8<sup>th</sup>class/ Matriculate/Intermediate/Graduate and  
above/Not applicable.
  - 9. Religion:** Hindu/Muslim/Christian
  - 10. Domicile:** Rural/Semi urban/Urban.
  - 11. Place of incident:** Home/Workplace/Road traffic/Other\_\_\_\_\_
  - 12. Date of Incident:** \_\_\_\_\_Time of incident: \_\_\_\_\_  
Morning/afternoon/Evening/Night
-

**13. Date of admission:** \_\_\_\_\_ Time of reporting: \_\_\_\_\_

Morning/afternoon/Evening/Night

**14. Date of discharge:** \_\_\_\_\_

**15. Date and time of death:** \_\_\_\_\_

**16. Brought by:** Police/Self/Relative/Passerby

**17. Status:** Victim/Accused

**18. Consent given for examination:** yes/no.

**19. Manner of incident:** Accidental/Suicidal/homicidal.

**II. Particulars about incident:**

**Road Traffic Accident:**

A. Victim:

- Pedestrian
- Bicyclist
- Motor cyclist- Driver/Pillion rider
- Light motor vehicle- driver/front seater/back seater.
- Medium motor vehicle- driver/front seater/back seater.
- Heavy motor vehicle- driver/front seater/back seater.
- Animal driven vehicle-

B. Injuries: \_\_\_\_\_

C. Offending vehicle: \_\_\_\_\_

D. Not known: \_\_\_\_\_

E. Others: \_\_\_\_\_

---

**Burns:**

A. Type: Dry heat/ Moist heat

B. Causative agent: \_\_\_\_\_

C. Total body surface area: \_\_\_\_\_

D. Degree: Superficial/ Deep.

**Poisoning:**

A. Type of poison \_\_\_\_\_

**Assault:**

A. Type of weapon: Hard blunt/Soft blunt/Sharp cutting /Firearm/Pointed.

B. Nature of injury: Simple/ Grievous

C. Site of injury:

**Fall from height:**

A. Type/ Place:

B. Injuries:

**Bites and Stings:**

A. Species:

B. Site of bite:

**Mechanical Asphyxia:**

A. Type: Hanging/Strangulation/Suffocation/Drowning

**Others:** \_\_\_\_\_

**20. Cause of death:** \_\_\_\_\_

**Place:**

**Date:**

**Signature.**
